Afrolandx QA Report

Site:	https://afrolandx.com (production)
Testing period:	2026-10-04 to 2026-10-07
Tools:	Playwright 1.63 with TypeScript, plus read-only scripts
Audience:	the owner and the product, operations and engineering team
Status:	Findings from live production testing; nothing was fixed.

Owner executive summary

Site: https://afrolandx.com (production). **Testing period:** 2026-10-04 to 2026-10-07. Findings are from live production testing; nothing was fixed.

Severity	Count
Critical	1
High	12
Medium	43
Low to Medium	4
Low	27
Active total	**87** (of 90 numbered; BUG-04 superseded, BUG-35 closed, BUG-38 resolved)

Paystack is in test mode on production (confirmed 2026-10-06), so real payments cannot be taken yet.

Top 8 findings

1. **No product can go live (BUG-01, Critical):** image upload returns HTTP 503 and approval needs an image, so the catalogue stays empty.
2. **Order and payment inconsistencies (BUG-14, 15, 16):** the same order showed ₦17,003 to the customer and ₦8,503 to the admin and on the Pay button, and unpaid orders appear as real orders.
3. **The checkout hides the real shipping cost (BUG-14, 17, 32, 34):** eight carriers all say "Rate on request" with a hidden estimated deposit of ₦7,500 to ₦9,000, a "Testing mode" banner is visible to shoppers and there is no phone field.
4. **Admin and operations risks (BUG-27, 29):** a vendor shows as approved with verification pending and the CAC number "Not provided", and ten shipping quote requests have been pending for about a month.
5. **Findability and trust (BUG-08, 09, 20, 21):** every page has the same title and no meta description, there is no content without JavaScript, and /robots.txt and /sitemap.xml return the 404 page with HTTP 200.
6. **Accessibility and security baseline (BUG-05, 06, 10, 19, 40):** icon-only buttons have no accessible name, gold text fails contrast, three security headers are missing, another user's order returns 500, and `X-Powered-By: Express` is exposed.
7. **Almost no emails are sent (BUG-76, 77, 78, 79):** only verification, sign-in and reset code emails exist; vendors get no email at any stage and customers get no "password changed" notice.
8. **Chat and AI features are open to anyone with no rate limit (BUG-82):** no data leaked and output rendering is safe, but anonymous visitors can run unlimited AI calls.

What held up (tested live)

- Customers receive 403 on every admin API checked; anonymous visitors receive 401; unapproved products are not public.
- The session cookie is Secure and HttpOnly; checkout redirects anonymous users to login.
- The chat assistant leaked nothing and rendered hostile output as plain text; a buyer cannot set an order to paid, shipped or delivered.
- Back and forward navigation, a deep-link refresh, offline mode and slow 3G all passed; no obvious secrets in the JavaScript bundles.

The 5 most important next steps

1. Fix image storage so products can be approved (BUG-01).
2. Make order totals consistent and handle unpaid orders: one server-side total, cancel and expiry (BUG-14, 16, 42).
3. Send vendor and customer emails (BUG-76, 77, 78).
4. Add rate limits on chat and signup (BUG-82, 67; login BUG-51).
5. Turn Cloudflare back on (it was turned off for the registration tests, Part F), and keep server-side limits.

Part A: Bug register (BUG-01 to BUG-90) 11

- Bug register (sorted by severity, then id) 11
- Afrolandx QA Bug Report 17
- Additional bugs from the second review pass (BUG-27 to BUG-40) 30

Part B: Recommendations (workflows, UX, design, security, shipping) 32

- Afrolandx: Product, UX and Security Recommendations 32
- SECOND PASS (2026-10-05): live walk of the previously skipped areas 51
- Addendum: Shipping partner platform (a Temu-style logistics model) 61
- Addendum B: Shipping model recommendation based on what already works in the market 67
- Addendum C: Review of the new shipping desk and the purchase flow (2026-10-06) 70

Part C: Agent app requirements spec 73

- Afrolandx Agent App: requirements spec (draft v1) 73

Part D: Courier vetting checklist 85

- Courier / shipping partner vetting checklist (v1) 85

Part E: Marketplace watchlist (research and re-crawl) 90

- Marketplace watchlist: research and re-crawl of Afrolandx (2026-10-07) 90

Part F: Tests still waiting on Cloudflare 95

- Tests to run when Cloudflare (Turnstile) is temporarily removed 95

Part G: Email audit (customer and vendor emails) 98

- Email audit: customer and vendor (2026-10-07) 98
- Proposed copy and layout 101
- Coverage diagram 102

Part H: Chat and AI features 104

- Chat and AI features: test results (2026-10-07) 104

Part I: Cleanup list for the developers 107

- QA data left on production: cleanup list for the developers 107

Part J: Manual test checklist 109

- Manual test checklist (steps automation cannot do) 109

Part K: Email and AI logs 110

- Email inventory and send plan 110
- Email send log 112
- Chat and AI prompt log 113

Appendix: evidence index and how to re-run 115

How to read this report

Evidence labels. TESTED = seen live. **INFERRED** = reasoned from behaviour. **NOT TESTED** = not examined. **PROPOSED** = a recommendation. Some Parts also use OBSERVED, OBSERVED LIVE, UNKNOWN, NOT FOUND, PASS, FAIL, WARN and High/Medium/Low source-confidence ratings, kept exactly as written in the source.

Severity. Critical, High, Medium, Low to Medium and Low are the tester's judgement. Colour is always paired with the text label.

Where things are. Part A is the bug register (BUG-01 to BUG-90; 87 active). Parts B to D are recommendations, the agent app spec and the courier vetting checklist. Parts E to H are the research watchlist, the registration tests, the email audit and the chat and AI tests. **The cleanup list for the developers is Part I.** Part J is the manual test checklist, Part K the email and AI logs, and the Appendix lists evidence and how to re-run the tests.

Editor's notes on this PDF. Wording, ids, severities and labels are as in the master. Personal email addresses are replaced with "the owner's email". One-time codes in the email screenshots are masked. Files named in Parts A to K and the Appendix (docs/, tests/, utils/, screenshots other than the six in this report) were not part of the bundle and are named only as paths. BUG-27 to BUG-40 have no short title or browser column in the master; the register table shows their "where" text as the title and "not stated" for browsers. Part A's original summary table is replaced by the sorted register below, with the same data.

Scope, method and results

Bug counts by severity

87 active of 90 numbered; BUG-04 is superseded by BUG-25, BUG-35 is closed and BUG-38 is resolved.

Severity	Count	Bug IDs
Critical	1	01
High	12	05, 08, 14, 25, 27, 29, 41, 42, 46, 50, 51, 76
Medium	43	02, 03, 06, 07, 09, 10, 11, 15, 16, 19, 20, 21, 22, 30, 31, 32, 33, 34, 36, 47, 48, 49, 53, 54, 55, 56, 58, 59, 60, 62, 64, 65, 66, 67, 68, 71, 73, 74, 77, 78, 82, 86, 87
Low to Medium	4	39, 75, 79, 83
Low	27	12, 13, 17, 18, 23, 24, 26, 28, 37, 40, 43, 44, 45, 52, 57, 61, 63, 69, 70, 72, 80, 81, 84, 85, 88, 89, 90

What held up (full list)

- Customers receive 403 on every admin API checked and "Access denied" on /admin; anonymous visitors receive 401.
- Unapproved (pending) products are not visible to the public.
- The session cookie is Secure and HttpOnly (SameSite=Lax).
- Registration is protected by a Cloudflare bot check, and checkout redirects anonymous users to login.
- Every internal link on 9 key pages resolves for the anonymous, customer and admin sessions. External 429 (Wikimedia) and 999 (LinkedIn) responses are rate-limit and bot-blocking, not broken links.
- Back and forward navigation, a deep-link refresh, offline mode and slow 3G all passed.
- The chat assistant leaked nothing (orders, customers, system prompt), rejected a forged system role, and rendered hostile output as plain text. A buyer cannot set an order to paid, shipped or delivered. No stack traces leak. Nothing overflows at 200% and 400% zoom, and reduced motion is respected. A password reset ends the old session.
- Email suite (`tests/emails.spec.ts`): 26 tests pass in 7.3 minutes on Chromium; the three existing emails are short, DKIM-signed, have a Reply-To and a text part.
- No obvious secrets were found in the JavaScript bundles, and http redirects to https.

2. Scope and method

What was tested

- Roles: anonymous, customer (a plain Customer account), and an account holding customer, vendor and admin roles.

- Areas: home, catalogue and search, product page, cart drawer, checkout (up to the Paystack hosted page), registration and login screens, profile, my orders, vendor dashboard and product creation, admin dashboard (all 11 tabs), policies, Events, Collab Drops, Discover, Lookbook, Reviews, chat widget, and mobile layouts.
- Quality dimensions: functional, console and network errors, broken links and images, permalinks, accessibility (axe), performance (load time and largest contentful paint), SEO, passive security checks, access control and cross-user data access (read-only), responsive layout.

How

- Playwright 1.63 with TypeScript, using the Page Object Model (HomePage, ProductPage, CartPage, CheckoutPage, AuthPage, AccountPage).
- Browsers actually run: Desktop Chrome and Pixel 7 (both Chromium). Firefox, Safari (WebKit) and iPhone 14 are configured but were **not run** because the browser downloads timed out. Enable them with `ALL_BROWSERS=1` after installing.
- Read-only scripts for access matrices, link and permalink sweeps and screenshot baselines (anonymous, customer and admin, 9 pages each).
- Sessions for logged-in testing were created by the owner signing in manually in a visible browser; passwords were never shared with the tester. Sessions are stored as local files (see section 4).
- The site was walked role by role and the findings written up as Part B. No write requests were made.

Safety rules followed: no real payment was made; card details were never entered; no one else's data was changed; clearly labelled test data only. Exceptions authorised by the owner are listed in section 4.

3. Results

Automated test suite (`npm test`; fast post-deploy check `npm run test:smoke`, 5 tests)

Run	Result
Run 1: full suite, Chromium and Pixel 7, 1 retry	110 test executions: 47 passed, 46 failed, 17 skipped. About half of the failures were mistakes in the tests themselves (the registration button is disabled by the bot check, the mobile menu has a different label, navigation is collapsed on mobile, filters sit behind a button). These were corrected.
Re-run of the changed specs	51 passed, 7 failed, 4 skipped. Remaining failures matched BUG-02, BUG-04/25 and BUG-12; one Pixel 7 header-search test was then skipped on mobile.
Logged-in account tests (new)	21 passed, 4 failed, 1 skipped. The "my orders" selector was fixed and now passes. The protected-route test fails because of BUG-25.
Final complete run (2026-10-06), 15 spec files, Chromium and Pixel 7, 1 retry	**216 test executions: 125 passed, 78 failed, 13 skipped, 0 flaky.** Of these, 134 are regression tests (122 passed, 11 skipped, 1 failed: the BUG-44 header check, since re-tagged as a bug guard) and 82 are **bug guards** tagged `@bug BUG-xx` (77 failed as intended, 2 skipped, 3 passed; two of those three were re-tagged afterwards because they are not bugs). The guards cover BUG-01, 02, 03, 05, 08, 09, 10, 11, 12, 13, 17, 19, 20, 21, 22, 25, 26, 31, 39, 40, 44, 46, 47 and 50.
Not re-run after the last tag fixes	Three test titles were corrected after this run (no test logic changed).

Run	Result
Three new spec files added afterwards (run separately)	**security-regression** and **a11y-keyboard** (42 executions: 29 passed, 6 skipped, 7 failed; five of the failures were bug guards and one was a test mistake that was fixed and now passes), and **trust-content** (36 executions: 20 regression tests pass, 16 bug guards fail as intended). Total test files: 15.
Registration and login API spec (2026-10-07)	`tests/auth-api.spec.ts`, 19 checks on Chromium: 15 pass, 3 bug guards fail as intended (BUG-69, BUG-71, BUG-51), 1 skipped (needs a signed-in session). Total test files: 16.
Email suite (2026-10-07)	`tests/emails.spec.ts`, 26 tests on Chromium: all pass (the bug guards for BUG-72, 76, 77, 79 and 80 are marked `test.fail` so a failed guard cannot restart the worker and re-send real email). About 25 live sends to throwaway inboxes. Total test files: 17 plus the helper `tests/_email.ts`. Run with `npm run test:emails`.
Chat and AI tests (2026-10-07)	About 35 prompts and endpoint probes (scripts utils/chat-*.ts and utils/ai-*.ts); results in docs/ai/findings.md.
Final no-owner batch (2026-10-07)	Order-status tampering, concurrent sessions, error-page leakage, zoom, reduced motion, awkward names, payment return page and a deletion and consent scan, by scripts (utils/final-*.ts); results in BUG_REPORT.md.
Guard re-run on 2026-10-07	All 82 `@bug` guards re-run: 78 still fail, 3 are mobile-only skips and 1 (BUG-31 on Pixel 7) passes only because the Pixel 7 layout differs from the 375 px Chrome check. **No guarded bug has been fixed yet.**

The failing tests that remain are intentional: every one is a **bug guard** whose title carries `@bug BUG-xx`. It fails today and will pass when that bug is fixed. Run only the guards with `npm run test:bugs`, and only the regression tests (which should stay green) with `npm run test:guards`. Skips are intentional too (an account that is already a vendor, an empty catalogue, mobile-only or desktop-only checks, or a missing login session). Paid checkout, the shipping workflow, registration and emails cannot be automated (Cloudflare, Paystack); they are listed in docs/MANUAL_TEST_CHECKLIST.md.

Performance (Chrome desktop): load 2.6 to 2.9 s and LCP 3.3 to 3.6 s on the home, products, events and policies pages (target LCP under 2.5 s). The home page took about 8 s to settle on first load.

Coverage gaps

- Firefox, Safari and iPhone 14 not run.
- Paystack is in **test mode** on production (confirmed). A live-mode payment was not tested. The new manual shipping operations desk (/shipping) was run end to end on order #28's shipment, from partner creation to "Delivered" (assignment, package details, cost quote, buyer shipping, booking, agency payment record, status updates). No delivery-confirmation queue, payout hold or vendor payout was found after Delivered, so the payout rules are not built yet. Real orders (#17, #19, #20) and their shipments were not touched.
- Vendor-side checks used a customer-plus-vendor account (no admin role), created by upgrading the plain customer account. A standalone brand-new vendor registration was not possible, because the Cloudflare bot check blocks automated browsers.
- **Registration, login, vendor-application approval, rejection and suspension, emails, the chat and AI features and a final no-owner batch were tested on 2026-10-07.** Still not done: payment outcomes with Paystack test cards (success, decline, abandon, refund, double-click), receipt, shipping and delivery emails, the last-unit race, uploads (blocked by BUG-01), the Cloudflare-on retest, Firefox, WebKit and real phones, partner invitations, any agent accounts, and a retest after fixes.

- Not tested: CSRF, file uploads, and 11 of the 12 policy pages. Admin role changes: no control was found in the UI (the account-details dialog is read-only).
- Several security items in Part B are marked INFERRED, not tested.

4. Test data and changes left on production

Please review and clean these up. Authorised by the owner for testing. **A cleanup run on 2026-10-07 (owner approved) suspended all QA vendors that could sell, which hid the QA products from shoppers; the QA cart was emptied. Product deletion failed (BUG-90), and nothing else can be deleted from the app.** The app has no delete route for users, vendors, orders or shipments. The full list with ids is in docs/CLEANUP_LIST.md.

Item	State	Notes
Vendor "QA TEST Vendor (Afrolandx)" (id 5) on the admin test account	Approved	Created through the vendor form with a random test CAC number; a manual verification was recorded and the owner approved it. The verification record states a synthetic number.
Product 11 "QA TEST - DO NOT BUY"	Pending, no image	Created for testing; cannot be approved without an image.
Product 12 "QA TEST 2 - DO NOT BUY" (₦1, stock 3)	**Live and approved** (visible to the public)	Created with an image URL; shows "Product photo unavailable". Owner agreed to a short public window.
Order #27	Unpaid, "Awaiting Shipping Quote" (₦8,503 admin view, ₦17,003 customer view)	Shipping quote Request #11 for this order is still pending. My Orders now offers "Cancel Order" on newer orders; cancel this one or leave it for the owner.
Order #28 (test purchase, 2026-10-06)	**Paid** in Paystack test mode, ₦2.00, "test shipping"; status still "Awaiting Shipping Quote"	Created a vendor shipment (#2, "Preparing") in the new /shipping desk. Product 12 stock is now 2. Do not delete the records until the owner has reviewed the shipment flow.
Vendor "QA TEST Vendor Two (Afrolandx)" (id 6) on the former plain customer account	Approved (roles: customer, vendor)	Random test CAC RC4072111; verification recorded. The vendor-side tests used this account.
Product 13 "QA TEST 3 - DO NOT BUY" (₦1, stock 3, now 2)	**Live and approved**	Created with an image URL (photo upload still returns 503).
Order #29 and shipment #3	Paid ₦2.00 (test mode); vendor marked ready; partner assigned; ₦1 cost quote approved; buyer shipping Request #13 confirmed at ₦1; booking QA-TEST-BOOKING-0002; **immutable agency payment record ₦1.00** (QA-TEST-PAYMENT-0002); **Delivered (locked)** via a Delayed step	Same limits as shipment #2: the records cannot be edited from the UI.
Test partner "QA TEST Courier (do not use)" (qa-test-partner@example.com)	Active in the /shipping roster	No invitation sent. Pause or remove it when testing is finished.

Item	State	Notes
Shipment #2 (order #28)	**Delivered (locked)**; booking QA-TEST-BOOKING-0001; partner cost quote ₦1.00 approved; **immutable agency payment record ₦1.00** (QA-TEST-PAYMENT-0001); tracking QA-TEST-TRACK-0001	Shipping quote Request #12 is confirmed at ₦1. Request #11 (order #27) is still pending. The payment record and delivered state cannot be edited from the UI.
27 throwaway QA accounts (2026-10-07)	Unverified and verified customers and vendors named `qa-reg-*`, `qa-customer-*`, `qa-vendor2*`, `qa-afx-*` on throwaway Mailinator and mail.tm inboxes	Created through the real signup form and API during the registration, email and AI tests. The admin cannot delete users, so a developer needs to remove them (ids in docs/CLEANUP_LIST.md).
Vendors 7 to 12	5, 6, 7, 8, 9 and 11 suspended; 10 and 12 pending (verification rejected)	All QA TEST. Products 12 and 13 are hidden because their vendors are suspended, but still stored. Order #30 (unpaid) and three Lookbooks on the QA customer account were also created.
Cart	Emptied by the paid purchase	Verify before the next test.
Session files `.auth/state.json` and `.auth/admin.json`	Live login sessions stored locally	**Delete these files when testing is finished** and sign out the sessions. They are git-ignored.

Test actions taken as admin: submitted a vendor application and saved a CAC number, recorded a vendor verification, created two products, approved one, placed one order up to the Paystack page and attempted to confirm a ₦1 shipping quote, which the server refused ("Wait for the buyer payment to be confirmed before approving a lower final shipping price"). On 2026-10-06 a second order (#28, quantity 1, ₦1 test shipping) was placed and paid by the owner in Paystack **test mode** using a test card; the automated tester never entered card details. No real money moved.

---

5. Corrections log

- **BUG-04** (empty page when logged out) is superseded by **BUG-25**: logged out, /profile and /my-orders show the "404 Page Not Found" text. /account, /orders, /wishlist and /cart are 404 even when logged in; they are not real routes.
- **BUG-28** ("quote cards pre-filled with ₦25,000") was checked live and corrected: ₦25,000 is placeholder text, and all 11 value fields are empty. It is now a Low issue about a realistic placeholder.
- The "quantity 2" seen in the cart during testing was caused by the test script clicking Add to Cart repeatedly; it is not a site bug.
- **BUG-35** (vendors seeing platform notifications) was **not reproduced** with a vendor-only (customer plus vendor) account, so it is closed as admin-role bleed and removed from the active counts (it stays in the register for history). BUG-46 and BUG-47 were confirmed with that vendor-only account.

- **Password reset exists.** An earlier note said no reset was seen. There is a "Forgot password?" link on the password sign-in screen, a `/forgot-password` page and a working code-based reset; only changing the password from inside the profile is still marked "Coming Soon".

- **Google Analytics:** the analytics request seen during the first purchase came from Paystack's own page, not from Afrolandx.

6. How to read the rest

Part A: Bug register (BUG-01 to BUG-90)

BUG-01 to BUG-26 come from the automated suite and the read-only role, link and permalink checks. BUG-27 to BUG-40 come from the second review pass over the admin tabs, vendor area and content pages (table below). BUG-41 to BUG-50 come from the paid test purchases, the shipping desk and the vendor-only account on 2026-10-06. BUG-51 and BUG-52 come from the registration and login exploration. BUG-53 to BUG-57 come from the security, keyboard and admin-dialog tests. BUG-58 to BUG-63 come from the research-based re-crawl on 2026-10-07 (see Part E). BUG-04 is superseded by BUG-25, BUG-28 was corrected, BUG-35 is closed and BUG-38 is resolved (see the corrections log).

Bug register (sorted by severity, then id)

ID	Title	Severity	Where	Browsers
BUG-01	Product image upload fails with 503, so no product can be approved and the catalogue stays empty	Critical	`/vendor` (Add/Edit Product)	All
BUG-05	Unnamed buttons on every page (critical axe violation `button-name`)	High	all pages	All
BUG-08	Same title on every page; no meta description, canonical or Open Graph tags	High	all pages	All
BUG-14	Same order shows different totals: ₦17,003 to the customer, ₦8,503 to the admin and on the Pay button	High	`/my-orders`, `/admin` Orders, checkout	Chrome
BUG-25	Logged-out `/profile` and `/my-orders` show "404 Page Not Found" (corrects BUG-04's "empty page")	High	`/profile`, `/my-orders`	All
BUG-27	Admin > Vendors > Review (a vendor with status "approved")	High	see title	not stated
BUG-29	Admin > Shipping Quotes	High (ops)	see title	not stated
BUG-41	After a successful payment the return page says "Payment confirmation unavailable… before trying payment again" although the order is paid	High	`/order-success`	Chrome
BUG-42	Order #28 total differs again: paid and stored ₦2.00, shown as ₦3 on My Orders (BUG-14 recurs)	High	`/my-orders`	Chrome
BUG-46	Vendor dashboard Orders tab says "No orders yet… after your first sale" although a paid order (#28) contains the vendor's product	High	`/vendor` Orders	Chrome
BUG-50	The "Test checkout shipping — ₦1" option and the "Testing mode" banner are visible to an ordinary non-admin buyer, so any customer could pay ₦1 shipping instead of ₦7,500–₦9,000	High	`/checkout`	Chrome
BUG-51	Password login is not throttled: 15 wrong passwords against a real verified account (1 s apart) all returned 401, and the correct password worked straight afterwards; there is no lockout, delay or bot check (email-code login, by contrast, locks after 7 wrong codes)	High	`/login`, `/api/login`	All

ID	Title	Severity	Where	Browsers
BUG-76	Vendors receive no email at any stage: application submitted, approved, suspended, reactivated or rejected (the admin's typed rejection reason is never delivered); tested with 3 inboxes and 75 to 100 s waits	**High**	vendor emails	All
BUG-02	A long search string causes ~4500px of horizontal overflow	**Medium**	`/products`	Chrome, Pixel 7
BUG-03	Unknown URLs return HTTP 200 with a "404" body (soft 404)	**Medium**	any bad URL	All
BUG-06	Low colour contrast, mostly gold text (`.text-nigerian-gold`)	**Medium**	/, `/products` , `/policies`	All
BUG-07	Invalid ARIA attribute on the "Security check" widget	**Medium**	`/register`	All
BUG-09	No visible content without JavaScript	**Medium**	/	All
BUG-10	Missing security headers: CSP, X-Content-Type-Options, Referrer-Policy	**Medium**	all responses	All
BUG-11	LCP is 3.3–3.6s on every key page; the home page takes 8s to settle	**Medium**	/, `/products` , `/events` , `/policies`	Chrome
BUG-15	Opening `/checkout` directly redirects to `/products` , so a refresh or bookmark loses checkout	**Medium**	`/checkout`	Chrome
BUG-16	Unpaid orders appear as real orders; customers have no cancel button; abandoned orders raise admin alerts	**Medium**	`/my-orders` , `/admin`	Chrome
BUG-19	Asking for another user's existing order returns 500, not 403/404 (reveals which order IDs exist)	**Medium**	`/api/orders/:id`	n/a
BUG-20	`/robots.txt` , `/sitemap.xml` and `/manifest.json` return the app's 404 page with HTTP 200	**Medium**	site root	All
BUG-21	One product, many URLs: `/products/12/` , `/Products/12` , `/products/12abc` and ?utm=… all serve product 12 with no canonical tag	**Medium**	`/products/:id`	All
BUG-22	`/discover` shows raw JSON ({"message":"Unauthorized"}) to anonymous users and "Admin access required" to customers	**Medium**	`/discover`	All
BUG-30	Admin > Analytics	**Med**	see title	not stated
BUG-31	Mobile 375px: Admin > Vendors (scrollWidth 566), Admin > Users (551), vendor dashboard all tabs (388), `/checkout` (412)	**Med**	see title	not stated
BUG-32	Mobile `/checkout`	**Med**	see title	not stated
BUG-33	Return Policy vs `/my-orders`	**Med**	see title	not stated
BUG-34	`/checkout`	**Med**	see title	not stated
BUG-36	`/discover` (admin preview)	**Med**	see title	not stated
BUG-47	Customer and vendor timelines expose internal shipping-desk events and details (partner name, cost-quote approval notes, agency booking reference); one notification reads "Test shipping shipping quote ready"	**Medium**	`/my-orders` , `/vendor`	Chrome

ID	Title	Severity	Where	Browsers
BUG-48	Shipping desk accepts "Delivered" with only free-text "evidence", no file or signature, no second approver, and no timing checks (Collected to Delivered in one minute); delivery then locks the shipment	**Medium**	`/shipping`	Chrome
BUG-49	Vendor "Ready for pickup" fails with HTTP 500 ("Could not save shipping update") when the contact phone is in international format (+234…); the local format (080…) works	**Medium**	`/shipping` (vendor)	Chrome
BUG-53	Checkout: clicking Pay does nothing, with no message, when the account has no last name on file (silent validation failure; root cause is BUG-65, the signup form sends an empty last name for a one-word name)	**Medium**	`/checkout`	Chrome
BUG-54	The cart drawer is not keyboard accessible: focus does not move into it, is not trapped, there is no dialog role, and Escape does not close it	**Medium**	cart drawer	Chrome
BUG-55	Admin "Suspend" on a vendor sends the request immediately, with no confirmation and no reason	**Medium**	Admin > Vendors	Chrome
BUG-56	Admin "Reject" on a pending product sends the request immediately, with no reason and no confirmation (the vendor never learns why)	**Medium**	Admin > Product Approvals	Chrome
BUG-58	Every page ships about 1.8 MB of compressed JavaScript (login and policy pages included) against a recommended 300 KB, and the home page loads about 3.4 MB of images	**Medium**	all pages	Chrome
BUG-59	No guest cart or checkout: anonymous visitors cannot add to the cart (cart API returns 401) and checkout redirects to login	**Medium**	cart, `/checkout`	All
BUG-60	Sparkle icons and "AI" labels on public pages (Events, Collab Drops "AI Suggest", Lookbook); the chat assistant is not labelled as automated; the privacy policy does not mention AI or the provider	**Medium**	`/events`, `/collab-drops`, `/lookbook`, chat	All
BUG-62	The prohibited-products policy has no antiquities, cultural-heritage or provenance rule, although the site shows heritage imagery and sells carvings and art	**Medium**	`/policies/prohibited-and-restricted-products`	All
BUG-64	Weak passwords are accepted at signup: only a length of 8 is enforced, so `12345678`, `password` and a password equal to the email all pass (combined with BUG-51, guessable)	**Medium**	`/register`, `/api/register`	All
BUG-65	Accounts can be created with no first name or no last name; the form splits a one-word name and sends an empty last name, which later makes checkout's Pay button do nothing (root cause of BUG-53)	**Medium**	`/register`, `/api/register`	All
BUG-66	No limits on names: a 10,000-character first name was accepted and makes the admin Customers and vendors page about 96,000 px wider than the window (HTML in names is escaped correctly)	**Medium**	`/api/register`, admin	All

ID	Title	Severity	Where	Browsers
BUG-67	No server-side signup rate limit: 14 accounts were created in about a minute from one machine (it relies entirely on the Cloudflare bot check); unverified accounts also count as "active users" in admin (7 became 22)	**Medium**	`/api/register`	All
BUG-68	Vendor application accepts any CAC value (`XYZ`) and accepts a CAC number and business name that another vendor already uses; only a human verifier can catch impersonation	**Medium**	`/vendor` , `/api/vendors`	All
BUG-71	Account enumeration: requesting a sign-in code for an unknown email returns 404 "No account found with that email. Please create one first.", and signup returns 409 "An account already exists for this email", while login and password reset are generic	**Medium**	`/api/send-login-otp` , `/api/register`	All
BUG-73	Admin > Vendors row buttons Approve, Reject, Suspend and Reactivate act instantly: no confirmation dialog and no reason field, and no audit entry is shown (the Review dialog does have a rejection-reason field, but the row button skips it)	**Medium**	`/admin` Vendors	Chromium
BUG-74	Row-level Reject on a pending vendor application sets the status to "suspended" (the row then offers Reactivate), not "rejected"; the applicant is not told the difference and the separate rejected state is unreachable from the row	**Medium**	`/admin` Vendors	Chromium
BUG-77	No "password was changed" notice after a completed reset, and no new-sign-in alert	**Medium**	account emails	All
BUG-78	Payment receipt, shipping and delivery emails are untested (order creation correctly sends nothing); needs one Paystack test-card payment to a real inbox	**Medium**	order emails	coverage gap
BUG-82	`/api/chat` and the Collab Drops AI Suggest are open to anonymous visitors with no rate limit (10 back-to-back chat calls all returned 200): AI cost abuse and free general-purpose model use	**Medium**	`/api/chat` , `/api/collab-drops/ai-suggest`	All
BUG-86	The chat widget is not a dialog and has no accessible names (open, close, send, message input all unnamed); Escape does not close it	**Medium**	chat widget	All
BUG-87	No cookie consent banner, and no way to request account deletion or a data export anywhere on the site or in its code (NDPA 2023 data-subject rights and the cookie rules)	**Medium**	whole site	All
BUG-39	GET `/api/products` (anonymous)	**Low-Med**	see title	not stated
BUG-75	Vendor review accepts a CAC number of "XYZ" and any typed registered name once the three self-attest checkboxes are ticked; no format check (RC plus digits) at verification time, so a fake CAC can reach Verified and Approved	**Low-Medium**	`/admin` Vendor review	Chromium
BUG-79	Account emails are minimal: no doctype or html wrapper, no hidden preheader, no footer or support line on sign-in and reset, no dark-mode support, no logo	**Low-Medium**	emails	All

ID	Title	Severity	Where	Browsers
BUG-83	Lookbook generation barely validates input: eventType accepts any text and saves a record; negative budget, huge familySize, oversize styleNotes and wrong fields all return the same message "Describe your style or choose an event type" with no stated limits	**Low-Medium**	`/api/lookbooks/generate`	All
BUG-12	Price filter accepts negative values	**Low**	`/products`	All
BUG-13	Anonymous visitors trigger 401 console errors on every page	**Low**	all pages	All
BUG-17	"Testing mode" banner is shown to real shoppers on production checkout	**Low**	`/checkout`	Chrome
BUG-18	Empty white box in the header next to the cart icon (logged-in users)	**Low**	header	Chrome
BUG-23	Category-bar item "⭐ Collab Drops" is clipped ("Collab |") at 1280px wide	**Low**	header	Chrome
BUG-24	Logged-out `/lookbook` has no header or navigation, only a sign-in card	**Low**	`/lookbook`	All
BUG-26	Unknown `/api/...` routes return HTML with status 200	**Low**	`/api/*`	All
BUG-28	Admin > Shipping Quotes	**Low**	see title	not stated
BUG-37	Cart drawer	**Low**	see title	not stated
BUG-40	All responses	**Low**	see title	not stated
BUG-43	A paid order with the ₦1 test shipping still reads "Awaiting Shipping Quote"; the shipment shows "Weight not recorded"	**Low**	`/my-orders`, `/shipping`	Chrome
BUG-44	Header overflows at 1280px for roles with the extra Vendor, Admin and Shipping links: measured 43px of sideways overflow on `/admin`, `/shipping` and `/vendor`	**Low**	header (vendor/admin roles)	Chrome
BUG-45	Shipping desk: "Save status update" for "Collected" stays disabled (until the agency payment is recorded) with every visible field valid and no message saying why	**Low**	`/shipping`	Chrome
BUG-52	Registration shows no inline reason when the email is invalid or the passwords differ; the Create button just stays disabled (only the hint "Use at least 8 characters" is shown)	**Low**	`/register`	Chrome
BUG-57	The Events "Budget per person" field accepts negative, zero, fractional and absurd values (-100, 0, 0.5, 1e308) with no message	**Low**	`/events`	Chrome
BUG-61	No Contact page, and no physical address, phone number or WhatsApp channel in the footer (email link only)	**Low**	footer	All
BUG-63	Policy gaps: the privacy policy does not name the NDPA or NDPC, the processors (Paystack, Cloudflare, Google Fonts) or AI features; the return policy has no refund timeline in days; no accessibility statement	**Low**	`/policies`	All

ID	Title	Severity	Where	Browsers
BUG-69	Error responses leak internals: a malformed JSON body returns the parser's own message, and validation errors include schema details (`"code":"invalid_type"` , `"expected"` , `"received"`)	**Low**	`/api/*`	All
BUG-70	Throttle messages mislead: locked or rate-limited code and reset attempts return 429 with the body "Invalid sign-in code" or "Invalid reset code", no wait time and no Retry-After header; a used code is reported as "expired"; the attempt lock is per email, so anyone can lock another person's code login for a few minutes	**Low**	`/api/login-with-otp` , `/api/reset-password`	All
BUG-72	Account emails: sent from management@afrolandx.com, no "never share this code" line, no support contact or footer details; verification emails can be silently skipped ("Please wait before requesting a verification code") when several accounts are created close together	**Low**	emails	All
BUG-80	The vendor signup email is the customer welcome email; no "apply to sell" next step	**Low**	emails	All
BUG-81	A signup verification code sent to `/api/login-with-otp` returns "Sign-in code has expired", a misleading message	**Low**	`/api/login-with-otp`	All
BUG-84	A prompt-injection attempt in styleNotes returns 503 "Could not generate a matching lookbook right now" (a refusal or unparsable output reported as a server outage)	**Low**	`/api/lookbooks/generate`	All
BUG-85	The chat greeting promises help with orders but the assistant has no order access and there is no human hand-off	**Low**	chat widget	All
BUG-88	Signing in a second time silently signs out the first session (one active session per account); there is no session list or "sign out other devices"	**Low**	auth	All
BUG-89	GET `/api/products/abc` and a 20-digit product id return 500 "Failed to fetch product" instead of 400 or 404 (same class as BUG-19)	**Low**	`/api/products/:id`	All
BUG-90	Deleting a product fails unhelpfully: an admin gets 403 "This product does not belong to you" for another vendor's product, and 500 "Failed to delete product" for a product that orders reference (should be a clear 409 with a reason); vendors cannot remove test products once orders exist	**Low**	DELETE `/api/products/:id`	All

Not active (not counted in the 87)

Afrolandx QA Bug Report

Target: https://afrolandx.com (production, read-only testing). Browsers run: Desktop Chrome and Pixel 7 (Chromium engine). Date: 2026-10-04.
Evidence: HTML report in `playwright-report/`, screenshots and traces in `test-results/`, raw results in `docs/results.json` and `docs/results2.json`.

Details

BUG-01: Product image upload returns 503; no product can go live (Critical)

- Steps: as an approved vendor, create a product (QA TEST - DO NOT BUY), then edit it, add a photo and click "Save Changes + Upload 1 photo".
- Expected: the image is stored.
- Actual: `POST /api/products/11/images` returns 503 "Product image storage is unavailable. No images were added." Approving the product then fails with 409 `missing_image` ("Product is not eligible for approval").
- Impact: vendors cannot get products approved, which is the likely reason /products shows "0 pieces". Pasting an image URL at creation time works around it (product 12 was approved this way), but its photo still shows "Product photo unavailable".
- Likely cause: the image storage backend or credentials are misconfigured or down in production.

BUG-02: Long search input breaks layout (Medium)

- Steps: on /products, type 500 × "a" in "Search pieces, materials, makers…".
- Expected: the text is truncated or wrapped and the page stays within the viewport.
- Actual: `scrollWidth` exceeds the viewport by 4533px, giving a horizontal scrollbar.
- Evidence: test "search handles input: aaaa…" (screenshot in `test-results/`).
- Likely cause: the echoed query is rendered in an element with no `overflow-wrap` or `max-width`.

BUG-03: Soft 404 (Medium)

- Steps: GET /this-page-does-not-exist-qa.
- Expected: HTTP 404.
- Actual: HTTP 200 with "404 Page Not Found" in the body, which can cause SEO indexing of junk URLs.
- Likely cause: the SPA fallback serves index.html with 200 for every route.

BUG-04: Protected pages show an empty page when logged out (High)

- Steps: logged out, open /profile or /my-orders.
- Expected: redirect to /login, as /checkout does.
- Actual: the URL stays the same and the main content area is empty. There is no redirect and no message.
- Correction to the earlier version of this report: /account, /orders, /wishlist and /cart are 404 even when logged in, so those routes simply don't exist. The real routes are /profile and /my-orders.

BUG-05: Buttons with no accessible name (High)

- axe `button-name` (critical) on /, /products, /login, /register and /policies. One example is the floating chat button (`.bottom-6`, `data-testid=button-open-chat`). On /login and /register the unnamed buttons sit in the `.gap-2` and `.whitespace-nowrap` containers.
- Fix: add `aria-label` to icon-only buttons.

BUG-06: Colour contrast (Medium)

- axe `color-contrast` (serious): 24 nodes on /products, 14 on /policies, 2 on /. The gold text class `.text-nigerian-gold` on the beige background is the main offender.

BUG-07: Invalid ARIA on the Security check widget (Medium)

- axe `aria-prohibited-attr` on `div[aria-label="Security check"]` on /register.

BUG-08: Missing SEO metadata (High)

- Every crawled page (21) has the title "Afrolandx - Authentic African Fashion". None has a meta description, canonical link or `og:title`.
- Impact: poor search snippets and poor link previews when shared on WhatsApp or social media.

BUG-09: No content without JavaScript (Medium)

- With JS disabled, the home page body has fewer than 200 characters of text. Crawlers that don't run JS see an empty page. This compounds BUG-08. Consider server-side rendering or prerendering for key pages.

BUG-10: Missing security headers (Medium)

- Missing on `GET /`: `Content-Security-Policy`, `X-Content-Type-Options`, `Referrer-Policy`.

BUG-11: Slow LCP (Medium)

- Chrome desktop, load / LCP: `/` 2.6s / 3.6s, `/products` 2.9s / 3.5s, `/events` 2.9s / 3.4s, `/policies` 2.7s / 3.3s. The target is under 2.5s LCP. Load times are close to the 3s limit.
- The first crawl measured 8s to network idle on the home page, which has a 9-image carousel.

BUG-12: Negative price accepted (Low)

- Steps: on /products, type -5 into "From".
- Expected: rejected or clamped to 0. Actual: -5 is accepted.

BUG-13: 401 errors in console for anonymous users (Low)

- `/api/cart` and `/api/auth/user` return 401 on every page load and log a console error. This is likely expected for logged-out visitors, but the noise makes real errors hard to spot. Consider returning 200 with null.

BUG-14: Order total differs between views (High)

- Steps: add the QA product (qty 3, ₦1 each) and check out with DHL (estimate ₦8,500). The Pay button says ₦8,503. Order #27 then shows ₦17,003 in My Orders and ₦8,503 in the admin Orders tab.

- Expected: one consistent total. Actual: the customer sees about double the amount charged and shown to the admin.
- Needs a human check of which figure is intended (the banner says the final carrier quote and any remaining balance are collected later).

BUG-15: Checkout cannot be reached directly (Medium)

- Steps: with items in the cart, open https://afrolandx.com/checkout directly or refresh the checkout page.
- Expected: the checkout page, or a clear message. Actual: redirect to /products. It only works via the cart drawer's "Proceed to Checkout".

BUG-16: Unpaid orders and no cancel option (Medium)

- Clicking "Pay" creates the order (`POST /api/orders/initialize-payment` 200) before any payment. It appears as "Awaiting Shipping Quote | Pending" in My Orders and in admin Shipping Quotes (the count went from 10 to 11).
- Customers have no cancel button on /my-orders, yet "Customer cancelled Order #25/#26" events exist.
- Orders #19 and #20 have been awaiting a quote for 738 hours and are probably abandoned unpaid orders, so the admin alerts are noise.

BUG-17 and BUG-18 (Low)

- A "Testing mode: checkout includes an estimated shipping deposit…" banner is visible to real shoppers on production checkout.
- Logged-in users see an empty white box in the header next to the cart icon, on every page.

Access control, permalinks and link checks (new round)

Method: read-only GETs and page loads as anonymous, customer (Customer role only) and admin sessions. Files: `docs/access-matrix.json`, `docs/link-sweep.json`, screenshot baselines in `docs/baselines/<role>/`.

What held up (not bugs)

- Customers get 403 on every admin API checked and "Access denied" on /admin. Customer access to /api/vendors is 403.
- Anonymous visitors get 401 on cart, orders, notifications and admin APIs.
- Pending product 11 returns 404 to the public; only approved products are listed, so there is no pending-product leak.
- The session cookie `connect.sid` is Secure, HttpOnly and SameSite=Lax. The `GAESA` cookie is not Secure (informational, load-balancer affinity).
- All internal links on 9 key pages work for all three roles. External 429 (Wikimedia) and 999 (LinkedIn) responses are rate-limit and bot-blocking, not broken links.
- Behaviour is identical across roles for navigation links; only /admin, /vendor, /discover, /profile and /my-orders differ, as expected.

Bugs

- BUG-19: with a customer session, `GET /api/orders/19` and `/api/orders/27` (existing orders of other users) return `500 Failed to fetch order`, while `/api/orders/1` returns `404 Order not found`. No data leaks, but the status codes reveal which IDs exist and show the ownership check failing as an exception. Expected: the same 404 (or 403) for both.
- BUG-20: /robots.txt and /sitemap.xml return the 404 page body with HTTP 200, so search engines get HTML where they expect rules and a sitemap. /manifest.json does the same.
- BUG-21: /products/12/, /Products/12, /PRODUCTS and /products/12abc all render the product, and no page has a canonical tag, so search engines can index duplicates. /products/abc, /0 and /-1 return 200 with a "not found" style page.
- BUG-22: /discover is admin-only, but for others the browser shows a raw API error. It should redirect to login or show a friendly page, and the nav and footer links should be hidden for non-admins.
- BUG-23, BUG-24: layout issues seen in the baseline screenshots.
- BUG-25: correction to BUG-04. Logged out, /profile and /my-orders show the 404 page text (the main area was empty), not a redirect to /login.
- BUG-26: unknown API paths such as /api/my-orders return the app's HTML with 200 (a soft 404 for the API).
- Minor: /home and /index.html are soft 404s, and /events/1 and /reviews/1 show the 404 page with 200. The public product API exposes internal fields (`clientImportKey`, `vendorId`).

Paystack test mode: CONFIRMED (2026-10-06)

- The hosted payment page showed a "TEST" ribbon and "Pay NGN 2", so production checkout is connected to Paystack **test mode**. No real money moves. If the site is open to the public, real customers cannot pay real money yet; add "switch Paystack to live keys" to the go-live checklist.
- The earlier assumption that a ₦1 total could not be charged was wrong for test mode: a ₦2 payment (₦1 item plus the new ₦1 test shipping) completed. Live-mode minimum charges should still be checked with Paystack.

Purchase test with the new ₦1 shipping (2026-10-06, order #28)

Steps run: cart quantity set to 1, checkout with the new option "Test checkout shipping — ₦1 (Testing only, no carrier booking)", total ₦2, Pay, Paystack test mode, payment completed by the owner with a test card.

Worked

- The cart drawer, quantity change, address form and the ₦1 test shipping option all work; the Pay button showed the correct ₦2.
- Payment was recorded: order #28 `paymentStatus: paid`, total 2.00, shipping method "test shipping".
- A separate shipment (#2, "Fulfilled by Afrolandx shipping team") was created for the vendor automatically, with an event "Payment confirmed" and a customer-facing timeline.
- My Orders now offers "Cancel Order" and "Report issue" (BUG-16 and BUG-33 are partly addressed).

Bugs

- BUG-41: the return page `/order-success?order_id=28&reference=…` showed "Payment confirmation unavailable. We could not confirm a paid order from this link. Check My Orders before

trying payment again." at the same time as the order was paid. Customers could pay twice. The page may have checked before the payment was recorded (a timing problem), but it should wait and retry, or read the order's real state.

- BUG-42: the customer's My Orders card shows ₦3 for order #28, while checkout charged ₦2 and the order stores 2.00. Order #27 still shows ₦17,003 against ₦8,503 (BUG-14).
- BUG-43: the paid order still says "Awaiting Shipping Quote", and the shipment lists "Weight not recorded" (product weight is still optional).
- BUG-44: at 1280px the admin header (Home … Shipping) overflows and the cart and avatar are cut off.

Open

- It is not yet known whether ordinary customers can see the ₦1 test shipping option at checkout. The admin account can. Checking it needs an item in the plain customer's cart. If customers can see it, anyone could pay ₦1 shipping.
- Order #27 is still unpaid and pending. The test product's stock is now 2.

New shipping operations desk (/shipping, found 2026-10-06)

A manual operations workspace for admins, built since the first review. It contains a shipment register and status history, a partner roster (none registered yet), an "import a paid order" backfill, and a per-shipment workflow with package splitting, partner assignment, a partner cost quote, booking reference, payment record and a manual status update. It says updates are entered by the team and that it has no GPS or live carrier tracking.

- **Access control (TESTED):** anonymous users are sent to login; a plain customer sees "Shipping workspace unavailable"; `/api/logistics/partners` returns 401 or 403 for non-admins; a plain customer calling `/api/logistics/shipments` gets 200 with empty lists (0 shipments, 0 eligible orders), so no data leak.
- **Workflow run on order #28 only (2026-10-06):** see the next section. Real orders (#17, #19, #20) and their shipments were not touched.

Shipping desk workflow run on order #28 (shipment #2), 2026-10-06

Owner-authorised, on my own test order and a clearly labelled test partner "QA TEST Courier (do not use)" with the reserved address qa-test-partner@example.com (no invitation was sent; "Invite member" was not used).

Step	Result
Create partner	`POST /api/logistics/partners` 201; appears Active in the roster
Assign partner to shipment #2	`POST …/shipments/2/assign` 200; event recorded
Vendor package details and "Ready for pickup"	200; the panel states the vendor must supply package details before a quote (here typed by the admin: contact, pickup address, weight 0.5 kg, dimensions)
Partner cost quote (₦1 agency cost)	`POST …/quotes` 201, then Approve `POST /api/logistics/quotes/1/review` 200 ("Approved partner costs on this shipment: ₦1.00")
Buyer's final shipping	Admin Shipping Quotes, Request #12 (carrier "Test shipping"): confirmed ₦1, `PATCH …/shipping-quote-requests/12` 200; customer status moved from "Awaiting Shipping Quote" to **Processing**

Step	Result
Accept booking	Allowed only after the buyer's shipping was settled, as the panel says; `POST …/booking` 200, reference QA-TEST-BOOKING-0001
Status "Pickup scheduled"	200 (requires a scheduled date and time and a note)
Status "Collected"	**Blocked at first:** the form requires a tracking number (URL optional); with it and the note filled and valid, "Save status update" stayed disabled with no explanation (BUG-45). It unlocked only after the agency payment was recorded (next row), which confirms the prerequisite.
Record agency payment (immutable, owner-approved)	`POST …/shipments/2/agency-payment` 200: ₦1.00, invoice QA-TEST-INV-0001, payment QA-TEST-PAYMENT-0001. The desk notes it "does not initiate a bank transfer".
Collected, In transit, Out for delivery	Each saved with `POST …/status` 200 (Collected needed the tracking number QA-TEST-TRACK-0001)
Delivered	Saved with 200. The form asks for "Delivery evidence (required)" as a **free-text box only**; the entry used was "QA TEST Recipient". The shipment is now locked as Delivered.

Results after Delivered

- The customer's order shows "Delivered | Paid" and the timeline updates, but the page offers no "I received it", Return, Review or Report-a-problem buttons (BUG-33 remains). The Cancel button correctly disappeared.
- The vendor's Orders tab **still says "No orders yet"** (BUG-46 confirmed through delivery), while notifications keep arriving.
- No delivery-confirmation queue, payout hold or vendor payout statement appeared anywhere after Delivered. The platform currently stops at "Delivered"; the owner's payout rule (hold after delivery) is not built.
- The desk accepted Collected, In transit, Out for delivery and Delivered within one minute (12:20), with no sanity checks on timing.

What works well: a strict gated sequence (assign, details, quote, approve, buyer shipping settled, booking, payment record, status), warnings on immutable steps, one clear event history with the admin's name and time, the customer's status chip now matches ("Processing / Paid"), and the customer timeline updates automatically.

New bugs

- BUG-45: see the table; the Save button gives no reason when disabled.
- BUG-46: after the order was paid and a shipment created for this vendor, the vendor's Orders tab still says "No orders yet. Orders will appear here after your first sale." although the dashboard shows the product and ₦2 total value. Vendors may not see paid orders to fulfil.
- BUG-47: the customer's My Orders timeline shows internal operations events ("A partner cost quote was submitted for admin review", "Partner cost quote approved. Approved after operational review"), the courier's name and the agency booking reference. The vendor's notifications show the same internal events plus a message addressed to the buyer ("Your final Test shipping shipping price… covered by the estimate already paid"), with a doubled word. Customers should only see customer-relevant milestones; INFERRED: the test account holds customer, vendor and admin roles, so some of this may be role bleed (BUG-35).
- BUG-42 update: the customer card showed ₦3 for order #28 while the quote was pending and now shows ₦2 after the final shipping was confirmed. The total shown before confirmation is still wrong

or unclear.

- BUG-43 update: the "Awaiting Shipping Quote" label cleared once the quote was confirmed; the "Weight not recorded" part was fixed only by the admin typing a weight into the desk.
- Design note: the order of steps forces a human to type the vendor's package details in the admin; the vendor has no screen for it (not seen).

Vendor-only account tests, order #29 (2026-10-06)

Setup: the plain customer account was upgraded to a vendor by submitting the application ("QA TEST Vendor Two (Afrolandx)", random test CAC), verified in admin and approved by the owner. Its roles are `customer` and `vendor` only (no admin), and the admin account played the buyer. Product 13 (₦1) was created by that vendor, approved, bought with the ₦1 test shipping (order #29, paid ₦2.00, test mode), and the shipment (#3) was worked through the desk.

Findings

- **BUG-01 changed:** product creation with a real photo upload now fails outright: `POST /api/products` 503 "Product image storage is unavailable. Your product was not saved." Before, the product saved and only the image failed. The paste-a-URL workaround still works.
- **BUG-41 reproduced:** the return page again said "Payment confirmation unavailable" (order_id=29) while the order was `paid`. It has now happened on both test payments.
- **BUG-42 behaviour reproduced:** the buyer card showed ₦3 while "Awaiting Shipping Quote" and ₦2 after the final shipping was confirmed. Charged and stored amount: ₦2.00.
- **BUG-35 not reproduced:** the vendor-only account receives only its own notifications ("Shipment created", "New Order Received") and none about other customers' orders. The earlier noise came from the admin role.
- **BUG-46 confirmed for a true vendor:** the Orders tab says "No orders yet" although the vendor was told of the new order and `/api/logistics/shipments` returns its shipment.
- **BUG-47 confirmed with true roles:** the vendor's notifications and the buyer's timeline show "A partner cost quote was submitted for admin review", "Partner cost quote approved. Approved after operational review", "Assigned to QA TEST Courier (do not use)" and the agency booking reference. **Correction (checked 2026-10-06 after a partner was assigned):** the vendor's shipment API hides the agency cost `quotes` (null) but **does return `partnerName` and `bookingReference`**. My earlier statement that it hides the partner name was based on a check made before any partner was assigned.
- **BUG-49 (new):** the vendor's "Save status update" returned `POST 500 /api/logistics/shipments/3/status` with `+2348000000001` as the contact phone, and `200` with `08000000001`. The error should be a validation message, and international numbers should be accepted.
- **Privacy note:** the vendor's shipment record includes the buyer's full delivery address and name (`deliveryAddress` with address lines, city, postal code). Under the agent model the vendor ships to an intake point, so the buyer's address is not needed for the vendor.

What works well

- A vendor-specific desk: the vendor sees "Operations desk · Vendor pickup" with only its own shipments, reached through a "Pickup operations" button on its dashboard. It says "Vendor actions are limited to marking goods ready for pickup. Pickup, transit and delivery updates are recorded by

the shipping team", and the vendor cannot claim collection or delivery. (This corrects my earlier note that the vendor had no screen for package details.)
- The order of steps is now natural: the vendor supplies pickup details and marks the goods ready, then the admin assigns a partner, quotes, approves, settles the buyer's shipping and accepts the booking. Each event is labelled `vendor`, `admin` or `system`.
- Role scoping holds: the vendor's `/api/admin/orders` returns 403, `/api/orders` returns its own (empty) list, and its shipment list shows only its own shipment. (The vendor shipment record still includes the partner name and booking reference, see BUG-47.)

Research-based re-crawl (2026-10-07)

I researched typical marketplace failures (AI-label trust, Baymard checkout research, Nigerian trust barriers, FCCPC and NDPA, OWASP business logic, accessibility law, seller fraud, heritage provenance, performance budgets), built a 23-item watchlist, and re-crawled all 22 public pages. Full method, sources with confidence ratings and the item-by-item table are in **docs/MARKETPLACE_WATCHLIST.md**. Summary:

- **BUG-58 to BUG-63** are new (see the register). Guard tests for them are in `tests/trust-content.spec.ts`.
- **Passed:** no placeholders, broken encoding, doubled words or currency-letter errors on public pages (apart from our own QA data); no urgency or pre-ticked-box dark patterns; no "no refund" wording; no analytics or ad tracker fired on any page (first visit); prices are computed on the server; cart and stock validation is strong; account isolation holds.
- **Correction:** the Google Analytics request I saw during the first purchase came from **Paystack's page**, not Afrolandx. No Afrolandx page loads a tracker today.
- **BUG-38 resolved:** the admin "Delete unused" buttons are gone (the tab is now "Customers and vendors" with "View details").
- **BUG-05 extended:** the header search input has only a placeholder, no label, on most pages (unlabelled input on 14 of 22 pages).

Security, accessibility and admin-dialog tests (2026-10-06)

Method: my own QA accounts only. Cart changes were cleaned up. For the admin dialogs **every non-GET request was blocked in the browser** and logged, so nothing changed. Details of what was checked and what held up:

Held up (tested, now regression tests in `tests/security-regression.spec.ts`)

- **Cross-vendor isolation:** a non-admin vendor's shipment list contains only its own shipment; writing to another vendor's shipment returned 403 ("Only the assigned shipping partner can access this shipment"), partner assignment 403, and editing another vendor's product 403 ("This product does not belong to you"). Its notifications do not mention the other vendor's order. (Reading another user's order still returns 500, BUG-19.)
- **Cart and stock tampering:** quantity 0, -1, 2.5, "2", "abc", null and 1e21 all return 400; asking for more than the stock returns 409; a client-sent `price` is ignored (cart price stays the product price); a nonexistent or non-public product returns the same 404; another user's cart item cannot be changed or deleted (404) and stays in its owner's cart.
- **No client-trusted totals:** the checkout payment request contains only the shipping address, a shipping-method key (`"dhl"`) and a `checkoutRequestId` (an idempotency key). It carries no prices

or totals, so the server computes them. (Captured in the browser and blocked before sending; no order was created.)
- **Open redirect:** seven parameter names (`next`, `redirect`, `returnTo`, `redirectTo`, `continue`, `url`, `return_to`) with five payloads each never left afrolandx.com. Observation: the `next` parameter is not honoured at all (a logged-in user opening `/login?next=/profile` lands on `/`).
- **Login errors:** an unknown and a known email give the same message (see below).
- **Quote rejection** in Admin > Shipping Quotes needs a reason (the button stays disabled until one is typed). One oddity: the quote-review endpoint answers `400 Required` for an incomplete body before it checks permissions; permission should come first.

New bugs

- **BUG-53:** with no last name on the account, Pay does nothing and says nothing; with a last name the request is sent.
- **BUG-54:** cart drawer keyboard behaviour (tested with an item in the cart): opens with Enter but focus stays on the page behind (0 of 16 Tab presses stayed inside), no `role=dialog` / `aria-modal`, Escape does not close it, focus is not returned.
- **BUG-55 and BUG-56:** with writes blocked, the single click on "Suspend" (`PATCH /api/admin/vendors/6/status`) and on "Reject" (`PATCH /api/admin/products/11/status`) sent the request at once. One mis-click suspends a vendor or rejects a product, and the rejection carries no reason for the vendor.
- **BUG-57:** Events budget accepts any number; no request was sent (client-side only).

BUG-05 extended (keyboard walk, 40 Tab stops per page): no page has a skip-to-content link. Focusable controls without an accessible name: `/login` 6, `/register` 12 (the bot-check widget), `/vendor` 7, `/shipping` 2, product page 1. No visible focus indicator on the products search box and on 10 stops of the registration page.

BUG-11 extended (Pixel 7 emulation, CPU 4x slower, Slow 4G ≈ 1.6 Mbps, 150 ms): load 15.1 s on `/`, 17.0 s on `/products` and 15.4 s on `/login`, with about 5 to 11 seconds of main-thread blocking and about **2 MB transferred on every page, including `/login`**. With 6 to 9 requests, this points to one large JavaScript bundle shared by all pages (INFERRED: it may include admin and vendor code). Per-route code splitting would help low-end phones most.

UI changes seen during testing (the admin is being updated): the "Users" tab is now "Customers and vendors" with a "View details" button per row; the old always-visible "Delete unused" buttons (BUG-38) are gone, and "View details" offers only "Review vendor application" and "Close". The "Initialise categories" button is no longer on the dashboard header. The dashboard now has a subtitle ("Customer accounts, vendor approvals, orders, shipping operations, and support") and a "2 Low Stock" badge.

Registration, verification and login tests with Cloudflare off (2026-10-07)

Method: the owner temporarily turned the Cloudflare bot check off. I used **throwaway accounts on public Mailinator inboxes** (random long names; nothing real), generated passwords kept only in a local ignored file, and read the emails from the inbox. About 20 QA accounts were created in total (see the test-data table in the master report). Scripts: `utils/signup.ts`, `signup-verify.ts`, `reg-api.ts`, `vendor-app-tests.ts`, `login-flows.ts`, `password-lockout.ts`, `reset-flow3.ts`; automated checks in `tests/auth-api.spec.ts`. This **supersedes** the earlier exploration below, which could not create accounts.

Worked well (TESTED)

- **Customer signup** (`/register`): name, email, phone, password, confirmation, role choice; `POST /api/register` returns "Account created. Please verify your email."; the verification email arrived in **17 to 21 seconds**; the six-digit code (`autocomplete=one-time-code`, numeric keyboard, 15-minute expiry) signs the user in and lands on the home page with roles `customer`.
- **Vendor signup** (`/register?as=vendor`): same flow, then redirects to the vendor application form; roles stay `customer` until the application is submitted (then `customer` plus `vendor`, with status pending and verification pending). A not-yet-approved vendor cannot create products (403 "Approved vendor access required") and cannot reach admin or partner APIs.
- **No privilege escalation:** `signupIntent` of `admin` or `superadmin` is rejected (400). Extra `roles`, `isAdmin` and `emailVerified` fields at signup are ignored (the account is `customer`, unverified). A vendor application carrying `status:"approved"`, `verificationStatus:"verified"`, `isApproved:true`, a forged `userId` and `roles:["admin"]` created an ordinary pending vendor owned by the caller.
- **Validation:** missing or invalid email, 7-character password, missing or bad phone (server wants 7 to 15 digits) return 400; a 200,000-character body returns a clean 413; duplicate emails (including upper case) return 409 and are not created twice.
- **Unverified accounts:** logging in returns 401 "Please verify your email before signing in" with a hint, and the UI offers "Sign in with a code".
- **Email-code login and password reset:** both exist and work. Reset has a "Forgot password?" link on the password sign-in screen and a `/forgot-password` page, and the API answers identically for known and unknown emails. **Correction:** my earlier note that no reset existed was wrong; only "change password" inside the profile is still "Coming Soon".
- **Sessions:** the cookie is `HttpOnly; Secure; SameSite=Lax` and lasts 7 days. `POST /api/logout` destroys the server session, and an old cookie replayed afterwards is rejected (401). A used sign-in code cannot be reused. The login response contains no sensitive fields.
- **Throttles that exist:** code requests are limited (429 after about five, clearing within about 3 minutes); wrong codes lock after 7 attempts per email (8th returns 429), and the lock lifted within 5 minutes; reset codes behave the same way. Signup emails are skipped when many accounts are created close together.

New bugs: BUG-64 to BUG-72 (see the register), and BUG-51 raised to High after the lockout test on a real account. BUG-53's root cause is BUG-65.

Recommendations (PROPOSED)

1. **Passwords:** keep length 8 or more but also reject common and breached passwords (a built-in common-password list or a breach-check service) and passwords equal to the email.
2. **Throttle password login** per account and per IP with growing delays, then a lock or a bot challenge; return the same message and a clear "try again in N minutes". Do the same for signup (per IP and per email domain).
3. **Names:** require a first name, allow a blank last name only if checkout and emails handle it, limit length (for example 1 to 60 characters), and trim and normalise. Split one-word names on the client so a missing last name is not sent as an empty string.
4. **Enumeration:** make the code-request endpoint generic ("If that email has an account, a code was sent"), and consider a generic signup message too.

5. **Vendor application:** validate the CAC format (RC, BN or IT plus digits) and flag duplicate CAC numbers and business names for the verifier; keep a record of the registry lookup.
6. **Errors:** return one generic validation shape without library internals, and a safe message for malformed JSON.
7. **429 responses:** say "Too many attempts. Try again in N minutes" and send `Retry-After`; use "already used" instead of "expired" for a spent code.
8. **Emails:** send from a recognisable no-reply or support address, add "Never share this code" and a support contact, and make sure verification emails are not skipped silently.
9. **When Cloudflare is turned back on,** the signup protection returns. Keep server-side limits too, because the bot check alone was the only defence during this test.

Registration and login exploration (2026-10-06, earlier; superseded by the section above)

- **Registration form** (`/register` and `/register?as=vendor`): full name, email, a **required phone number** (type `tel`, placeholder +234, max 30 characters), password (min 8, `autocomplete=new-password`), confirmation, and an "I want to" choice (Shop as a customer, Sell as a vendor). Cloudflare Turnstile is present and the Create button is disabled until it passes. The vendor variant says "Verify your email, then complete your business application. Selling requires admin approval."
- **No account has ever been created through this form**, because the bot check blocks automation. The vendor accounts used in testing came from the application form on existing accounts. Registration tests for every role are waiting for Cloudflare to be removed temporarily; they are listed in docs/WHEN_CLOUDFLARE_IS_OFF.md.
- **BUG-52:** no inline errors for a bad email or mismatched passwords (the button just stays disabled).
- **Login:** an unknown email and a known email with a wrong password give the **same** message ("Invalid email or password", HTTP 401), so account existence is not revealed. **BUG-51:** the login page has no bot check, and 8 wrong-password attempts one and a half seconds apart against a nonexistent email all returned 401 with no throttling, lockout or challenge. Not enough to prove there is no limit; the higher-volume check is in the Cloudflare-off checklist.

Final live checks (2026-10-06)

- **Shipment #3 run to Delivered** (agency payment record QA-TEST-PAYMENT-0002, then Pickup scheduled, Collected, **Delayed**, In transit, Out for delivery, Delivered, all `200`). The "Delayed" branch works: from Delayed the desk offers Pickup scheduled, Collected, In transit, Out for delivery, Delivery failed and Returned, but not Delivered directly.
- **BUG-46 confirmed through delivery:** the vendor-only account's Orders tab still says "No orders yet" after Delivered, while its notifications show "Shipment #3 update: moved to Delivered".
- **BUG-50 (new, High):** a non-admin buyer (roles `customer` and `vendor`) sees the full list of nine shipping options including "Test checkout shipping — ₦1" and the "Testing mode" banner at `/checkout`. Nothing was placed; the cart was cleared. The option must be removed or restricted to admins before launch.
- **BUG-16 stands for unpaid orders:** order #27 (unpaid) offers only "View 1 item" and "Buy again", with no Cancel and no way to resume payment. Paid orders #28 and #29 show "Report issue", and Cancel Order appeared only while #28 was paid and not yet delivered.
- **Delivered orders** show no Return, Review or "I received it" action (BUG-33 remains).

Logged-in coverage (manual sign-in, session reused read-only)

Customer account, no orders. These pass: the session is recognised by the API and persists across reloads and pages; /profile shows email, role and member-since; Edit Profile opens and the email field is read-only; /my-orders shows an empty state; /vendor shows the vendor application form and an empty submit is blocked; the header shows the avatar instead of Sign In; a logged-in user visiting /login is sent away; /checkout does not bounce a logged-in user.
Not tested, to avoid changing your account: saving profile edits, logout, and submitting the vendor form. "Change Password" is marked "Coming Soon", so password change does not exist yet.

Not bugs (intentional protections found)

- Registration needs a Cloudflare Turnstile check, so the submit button is disabled for automation. Tests assert the disabled state instead of submitting.
- /checkout redirects anonymous users to /login (passes).
- Navigation back and forward, a deep-link refresh, offline mode and slow 3G all pass.
- No secrets were found in the JS bundles, and http redirects to https (both pass).

Test run totals

- Full run 1, before test fixes: 110 executed (47 passed, 46 failed, 17 skipped); about half of the failures were test problems, since corrected.
- Re-run of changed specs: 51 passed, 7 failed, 4 skipped. All 7 failures map to BUG-02, BUG-04 and BUG-12, except the Pixel 7 header-search test, which is now skipped on mobile. The remaining BUG-xx items come from run 1, unchanged.
- Retried once; the failures above are consistent, not flaky.

Coverage gaps

- Firefox, Safari (WebKit) and iPhone 14 were not run (browser downloads timed out).
- Product page, variants, cart, checkout form and shipping, as the catalogue is empty.
- Logged-in account, order history, addresses, wishlist, password reset and login success (need credentials; you said you would sign in manually).
- Contact and newsletter forms (none found on the pages crawled), the events and collab-drops flows, and the chat widget.

Top 5 recommendations

1. Add products on production, or give me a staging URL, so the shopping flow can be tested.
2. Add per-page titles, meta descriptions, canonical and Open Graph tags, and prerender or server-render key pages (BUG-08, BUG-09).
3. Fix accessibility: label the icon-only buttons and raise gold-text contrast (BUG-05, BUG-06).
4. Return real 404 status codes and redirect logged-out account routes to login (BUG-03, BUG-04).
5. Add security headers and fix the search overflow (BUG-10, BUG-02).

Vendor application admin path (2026-10-07, own QA vendors only)

- Approve is disabled until the Review dialog records a verification (registered name, listing status, three attestations, notes): good gate.
- BUG-73, BUG-74, BUG-75 above. Approve, Suspend and Reactivate each succeeded with only a toast.
- No status email appeared in the vendor Mailinator inbox for approve, suspend or reactivate; inconclusive, because earlier verification emails were also absent from the inbox listing. Re-check with the owner's real mailbox.
- QA Vendor Three was left suspended; the duplicate-CAC QA application is suspended. Both need developer cleanup.

Email audit (2026-10-07)

Full results: docs/emails/audit.md, coverage diagram docs/emails/email-map.png, proposed copy and layout in docs/emails/proposed/. 13 sends via throwaway mail.tm inboxes (docs/emails/send-log.md). Only verification, sign-in and reset emails exist. Vendor approval does not send a one-time password (not observed).

Chat and AI tests (2026-10-07)

Full results: docs/ai/findings.md (about 35 of 60 approved prompts used; log in docs/ai/prompt-log.md). No data leakage, safe rendering, size limits and access control held up; BUG-82 to BUG-85 found.

Final no-owner batch (2026-10-07)

TESTED and held up: buyer tampering with order status (400 or 403; order unchanged); no stack traces or secrets in error responses; sensitive paths (/.env, traversal) return the app page only; no horizontal scroll at 200% and 400% zoom on 7 key pages; prefers-reduced-motion respected (no running animations); names with emoji, accents, Arabic, 120 characters and HTML are stored and shown safely; /order-success refuses to confirm a fake reference or my unpaid order (known BUG-41: it makes no verification call); a password reset ended the old session. New: BUG-86 to BUG-89. Admin > Customers and vendors > Account details is read-only: no role-change control was found (the earlier note that superadmins change roles there was wrong). The same dialog shows raw status keys (awaiting_shipping_quote) and mixes NGN and ₦ formats.

Cleanup run (2026-10-07, owner approved)

All QA vendors that could sell (#5, #6, #9, #11) were suspended; this hid the QA products (public list empty, /api/products/12 and /13 return 404), which confirms that suspending a vendor hides its products. The QA carts were emptied. Product deletion failed (BUG-90). Users, vendors, orders and shipments cannot be deleted from the app (see docs/CLEANUP_LIST.md).

Additional bugs from the second review pass (BUG-27 to BUG-40)

ID	Where	One-line repro / evidence	Severity
BUG-27	Admin > Vendors > Review (a vendor with status "approved")	Open Review: VERIFICATION = pending, "CAC number: Not provided", verification checkboxes unticked, yet status is approved. The documented gate (CAC + manual verification + superadmin approval) is not enforced.	**High**
BUG-28	Admin > Shipping Quotes	**CORRECTED after verification: not a bug as first written.** The "25000" and "5-7 business days" are grey placeholder hints; all 11 cards have an empty value (checked: `placeholder="25000" value=""` on 11 of 11). A "Confirm quote" click with empty fields is not a pre-filled commit. Remaining Low issue: a realistic number as a placeholder can be mistaken for a real value, so use a neutral hint such as "Enter rate in ₦".	**Low**
BUG-29	Admin > Shipping Quotes	10 quote requests (#1-#10) still "pending", oldest about a month old (2 Sept); list is not sorted by age and has no aging flag. Request #11 shows "0.00 kg recorded", so weight-based quoting has no data.	**High (ops)**
BUG-30	Admin > Analytics	Low-stock row reads "undefined left"; Vendor Rankings reads "N31 products" (currency sign on a count); "Orders by Status" is 0 in every state although orders exist; "Orders by Country" shows only Nigeria although quotes exist for South Africa. Top banner "N0 revenue / 0 paid orders" contradicts the Orders tab "N8,503 Actual Revenue" (extends BUG-14).	**Med**
BUG-31	Mobile 375px: Admin > Vendors (scrollWidth 566), Admin > Users (551), vendor dashboard all tabs (388), /checkout (412)	Open each at 375px: horizontal scroll; Review/Suspend buttons run off the card. Extends BUG-02 to normal use.	**Med**
BUG-32	Mobile /checkout	Page is about 8,900px tall; Order Summary, Total and the disabled Pay button are at the very bottom, after 8 carrier cards and the Paystack box.	**Med**
BUG-33	Return Policy vs /my-orders	Policy says "Start a return through the order page"; /my-orders has no Return or Cancel action (see BUG-16).	**Med**
BUG-34	/checkout	No phone field; address inputs have no `autocomplete` attributes, so mobile autofill does not work.	**Med**
BUG-35	Vendor dashboard	Recent Notifications include "New shipping quote request ... [customer first name] placed an order ..." and "Order #19/#20 needs attention", which are platform-level events. INFERRED: the test account has admin + vendor roles so this may be role bleed; verify with a vendor-only account that vendors never see other customers' orders.	**Med (privacy, verify)**
BUG-36	/discover (admin preview)	"1 cities" (no plural); hard-coded promo content ("Save up to 40%", "Reach 50K+ travellers", "Promoted by Nigeria Tourism", discount deal cards) with active "Book" buttons while the banner says bookings and payments are disabled.	**Med**
BUG-37	Cart drawer	"Proceed to Checkout" matched 2 buttons in the DOM (duplicate element); cart line has no product image and a truncated name; "Clear cart" is a large red full-width button directly under the item (accidental tap risk; not clicked).	**Low**

ID	Where	One-line repro / evidence	Severity
BUG-38	Admin > Users	**RESOLVED (seen 2026-10-07).** The tab is now "Customers and vendors" and each row has "View details", which offers only "Review vendor application" and "Close"; the always-visible "Delete unused" buttons are gone. Original report: every row had a red "Delete unused" button with no confirmation tested.	Resolved
BUG-39	GET /api/products (anonymous)	Besides `clientImportKey` and `vendorId`, the public JSON exposes `sku`, `status`, `weight`, `dimensions`, `createdAt/updatedAt`, `metaTitle`, `returnPolicy`. TESTED.	**Low-Med**
BUG-40	All responses	`X-Powered-By: Express` on pages and /api; HSTS without `preload`; `GET /admin` returns 200 with the app shell to anonymous users (only data APIs answer 401). TESTED.	**Low**

Part B: Recommendations (workflows, UX, design, security, shipping)

Afrolandx: Product, UX and Security Recommendations

Date: 2026-10-05. Scope: https://afrolandx.com (production), reviewed read-only as anonymous, customer, vendor and admin.
Evidence base: BUG_REPORT.md (BUG-01..26), docs/baselines/, *docs/*.png screenshots, plus a fresh probe on 2026-10-05 (response headers of `GET /`, Pixel 7 screenshots in `docs/rec/`). Script: `utils/rec-probe.ts`.

Effort: S = under 2 days, M = 1-2 weeks, L = 2+ weeks. Impact: Low / Med / High.

What I did and did not test (honest scope)

Reviewed: existing screenshots for anonymous, customer, vendor and admin (home, products, product page, checkout, my-orders, admin dashboard + Orders tab, vendor dashboard, Add Product drawer), the BUG report, and a live mobile look at /, /products and /login plus response headers. Nothing was submitted, paid or changed.
NOT re-walked live in this pass (relied on earlier screenshots and the bug report): every admin tab other than Analytics/Orders (Reviews, Product Approvals, Shipping Quotes, Featured, Vendors, Users, Event Planners, Discover, System Overview), the vendor Orders/Measurements/Profile tabs, the vendor application form, /events, /collab-drops, /lookbook interior, the chat widget conversation, the AI Discover/Lookbook features (admin-only / login-gated), registration beyond the Turnstile, email-code login, and anything behind Paystack. Mobile (375px) was only checked for home, products and login. Security items (CSRF, rate limiting, upload validation, SSRF, webhook idempotency, session timeout, MFA) are inferred from behaviour and from the product description; I did not probe them actively (that would exceed read-only). Treat them as "verify", not "confirmed vulnerable". Not tested: Firefox/Safari, screen readers, real-device performance.

---

1. Executive summary: top 10 in priority order

1. **Fix the launch blockers that make the store unusable: image upload 503 (BUG-01) and the empty catalogue.** Until a product with a photo can be approved, every other improvement is moot. Add a pre-launch "store not open yet" state instead of "0 pieces" and seed 10-20 real products.
2. **Make the order and money model coherent (BUG-14, BUG-16).** One total shown everywhere; an order is only created or marked "placed" after payment succeeds; unpaid orders expire and are cancelled automatically. Verify Paystack webhook signature and idempotency.
3. **Separate admin access.** Dedicated admin entry (e.g. `admin.afrolandx.com` or an unlisted path with its own login), remove Admin/Vendor/Discover from public navigation for people without those roles, require MFA for admins, short sessions, IP/device options.
4. **Replace the 11-tab admin bar with a grouped, collapsible sidebar** with pending-count badges, global search/command palette and bulk actions (wireframe in section 3).

5. **Ship the security baseline:** CSP, `X-Content-Type-Options`, `Referrer-Policy`, drop `X-Powered-By`, HSTS preload (BUG-10), consistent 403/404 instead of 500 (BUG-19), real 404s (BUG-03, 20, 26), rate limiting and lockout on login and email-code.
6. **Lock down public APIs and uploads:** stop exposing `clientImportKey` / `vendorId`; validate and re-host images instead of storing arbitrary "Paste URL" links (SSRF and hotlink/abuse risk, plus the product-12 "photo unavailable" case).
7. **Fix SEO fundamentals (BUG-08, 09, 20, 21):** per-page titles/descriptions/OG, canonical tags, slug URLs (`/products/aso-oke-agbada-12`), robots.txt, sitemap.xml, prerendering. This is the marketplace's main free acquisition channel.
8. **Redesign checkout as a single total-first flow:** show a total with an explicit shipping estimate, remove the "Testing mode" banner (BUG-17), make /checkout refresh-safe (BUG-15), allow direct cancel, and treat the carrier "quote" as an estimate with a cap or pay-after-quote step instead of a hidden deposit.
9. **Build a customer /account hub and vendor/admin onboarding status pages.** Orders, profile, addresses, wishlist, measurements, notifications, change password (currently "Coming Soon"). Vendor application needs a stepper, checklist and status emails.
10. **Accessibility and design-system pass:** name every icon button (BUG-05), fix gold-on-beige contrast (BUG-06), remove the stray empty header box (BUG-18) and the clipped "Collab" item (BUG-23), unify toasts/dialogs/empty states.

---

2. Findings and recommendations by area

Format per item: **Problem** (evidence) / **Recommendation** / **Why** / **Effort / Impact**.

2.1 Admin access and navigation

A1. Admin shares the customer login and public navigation.

- Problem: "Admin" and "Vendor" sit in the main header for the admin account (docs/admin-now.png, docs/vendor-now.png); admins sign in at `/login` like customers; `/admin` is a guessable path; a customer who opens it sees "Access denied" (confirms the route exists). The one admin account holds customer+admin+vendor roles, so a single phished password gives full control.
- Recommendation:
  - Entry point: host the back office on its own origin (`admin.afrolandx.com`) or at minimum an unlisted path with its own login screen, own cookie (`__Host-` prefixed, separate session store) and no public link anywhere (header, footer, sitemap, robots). Customers' `/admin` returns the same 404 as any unknown route (not "Access denied"), so the route is not confirmed.
  - Navigation: render Admin/Vendor/Discover items only when the session has that role; for customers show "Sell on Afrolandx" instead of "Vendor" and hide Discover/Admin entirely (BUG-22: customers currently see an admin-only Discover link and raw JSON).
  - Authentication: mandatory MFA for admin roles (TOTP or passkey; email code alone is weak because email is the recovery channel), step-up re-authentication (re-enter password/code) before sensitive actions: approve vendor, change roles, export CSV, confirm quotes, change payout/bank details, delete.
  - Session: admin idle timeout 15-30 min, absolute timeout 8-12 h, session list with "sign out other devices", new-device email alert.

  - Network: optional IP allow-list or Cloudflare Access / Zero Trust in front of the admin host (the site is already behind Cloudflare Turnstile and a Google front end, so this is a configuration step).
  - Separate identities: staff should use a dedicated admin account, not the same account they shop and sell with. Remove the combined customer+admin+vendor role pattern for real staff.
  - Audit: the dashboard banner says "All admin actions are logged and audited" but no log is visible. Add an Audit Log screen (who, what, before/after, IP, time), exportable, immutable, retained 12+ months.
  - Role model (least privilege): Superadmin (roles, settings, vendor final approval, money), Operations (orders, quotes, shipping), Catalogue moderator (product approvals, featured, reviews), Vendor verifier (CAC checks only), Support (read-only users/orders, can message), Finance (payouts, export). Permissions checked server-side on each API, not only by hiding tabs. Keep the "verified superadmin" concept but give it an explicit permission list on a Roles screen.
  - Non-admins hitting admin URLs: 404 page with link home (not 403 text, not JSON). Log the attempt.
- Why: security (single largest blast radius in the system), compliance, owner request.
- Effort: M-L (separate host + MFA is the bulk). Impact: High.

A2. 11-tab horizontal bar wraps and will not scale.

- Problem: docs/admin-now.png shows the tab bar wrapping "System Overview" onto a second row, with the dashboard KPI cards, notification list and a banner pushing the actual work area below the fold (about 830px down at 1366 wide). Two nested nav bars (site header + category bar) sit above it, and the category bar (Women/Men/Kids...) is irrelevant for admin work.
- Recommendation: a vertical collapsible sidebar with groups (see wireframe in section 3):
  - Overview (Dashboard)
  - Operations: Orders, Shipping Quotes, Returns/Refunds (future), Payments/Payouts (future)
  - Catalogue: Product Approvals, Featured Products, Categories (replaces the "Initialise categories" button, which looks like a dangerous one-off setup action sitting in the page header)
  - People: Vendors (applications, verification), Users, Event Planners
  - Content: Reviews, Policies/pages, Lookbook/Discover, Collab drops, Events
  - System: System Overview, Audit Log, Roles & Permissions, Settings
  - Pending-count badges (the app already shows counts for Shipping Quotes, Vendors, Product Approvals; keep and add Reviews/Returns), a "needs attention" colour only when an SLA is breached.
  - Global search / command palette (Ctrl+K): jump to order #, user, vendor, product; run actions.
  - Breadcrumbs and consistent page header (title, primary action, filters).
  - Saved filters and bulk actions on every table (select rows, approve, reject with reason, export).
  - Responsive: under 1024px the sidebar becomes an off-canvas drawer with a hamburger; tables become cards.
  - Use a minimal admin shell: drop the storefront header and category bar on admin pages, keep a "View store" link.
  - Dashboard: put the KPI cards and the "Needs attention" queue on the top; move notifications to a bell with a drawer.
- Why: efficiency and room to grow (Returns, Payouts, Audit, Roles are all likely additions).
- Effort: M. Impact: High.

A3. Notification panel is noisy and stale.

- Problem: dashboard shows full-width red alert cards for Order #19/#20 "awaiting_shipping_quote for 738 hours" and "Customer cancelled Order #25/#26" (docs/admin-now.png); raw status key `awaiting_shipping_quote` in user-facing copy; every alert is styled as danger red including informational ones; the same notifications are duplicated to the vendor dashboard (docs/vendor-now.png shows admin-ish "Order needs attention" for orders the vendor may not own, and a party-popper icon next to a cancellation).
- Recommendation: notification bell with unread count and a drawer; severity levels (critical / needs action / info) with different colours; group duplicates ("2 orders waiting >30 days"); auto-resolve when the order is closed; humanise statuses ("Awaiting shipping quote"); give each alert a primary action button ("Open order", "Cancel unpaid order") and "Snooze"; stop alerting on unpaid/abandoned orders (see C4); scope vendor notifications to the vendor's own orders; replace the party-popper icon on cancellations.
- Why: alert fatigue hides real issues. Effort: S-M. Impact: Med.

A4. Product approval queue.

- Problem: product flow is vendor creates -> admin approves; approval fails with 409 `missing_image` (BUG-01), so the queue is a dead end; vendor is told "usually within 24 hours" but no SLA tracking exists.
- Recommendation: approval screen with a checklist (photos present and loadable, price sanity, description length, category right, no prohibited items per /policies/prohibited-products, shipping class set), side-by-side preview as customers see it, rejection reason picker with templated text sent to the vendor, "Request changes" separate from "Reject", bulk approve for trusted vendors, SLA timer ("waiting 18h of 24h"), and an "auto-approve for verified vendors with clean history" option later. Disable the Approve button with an explanation when `missing_image` instead of failing with a 409 after the click.
- Effort: M. Impact: High.

A5. Shipping quotes.

- Problem: 10-11 quotes awaiting, several for hundreds of hours; confirmation is manual per order; quote confirm flow is the only way an order progresses.
- Recommendation: aging chips (green under 24h, amber under 72h, red beyond), quote templates by carrier/zone/weight band that pre-fill the quote, "Request quote from carrier" action with a copyable summary, SLA promise to the customer ("quote within 24h"), automatic reminder to admin and to customer, auto-cancel and refund after N days. Longer term compute rates by weight/dimension from carrier APIs (DHL/UPS/FedEx rate APIs) so quotes become automatic for most orders.
- Effort: M-L. Impact: High.

A6. Orders and Users tabs.

- Problem: Orders tab (docs/admin-orders.png) has a hidden "history" toggle, "Legacy records preserved for audit but excluded from sales reporting" wording that confuses, KPI "Actual Revenue ₦8,503" vs top banner "₦0 / 0 verified paid orders" (two different revenue numbers on one screen), and the status chip row (All/Pending/...) counts only the current subset. Customer email address is shown in the list row.

- Recommendation: one definition of revenue (paid orders only) used everywhere; filters with date range, payment status, quote status, vendor; saved views; order detail page with timeline, payment reference, shipping, refund and notes; mask PII by default in lists (show on detail) and log exports; label "Export CSV" as sensitive requiring step-up auth.
- Effort: M. Impact: Med-High.

2.2 Vendor experience

V1. Onboarding.

- Problem: vendor application (CAC number) -> manual admin verification -> superadmin approval, observed only through notifications ("Vendor verification completed ... Afrolandx can now approve your vendor account"). No visible stepper, no status page, no required-documents checklist; the Vendor link in the header leads a customer straight to an application form (docs/auth-vendor.png).
- Recommendation: a /vendor/apply flow with 5 steps (Business details, CAC and ID documents, Bank/payout, Store profile, Review and submit), autosave, and a persistent status page (Submitted -> Under verification -> Awaiting final approval -> Approved / Needs info) with timestamps and expected time. Email and in-app notice at each transition; "Needs info" lets the vendor upload only the missing item. Show a requirements checklist before they start (CAC number, ID, bank account in business name, 3 product photos). Link the vendor agreement and listing standards policies at the relevant step. Admin side: a Vendors queue with verification checklist, CAC lookup link, notes, and separate permissions for "verify" vs "approve".
- Effort: M. Impact: High.

V2. Dashboard.

- Problem: dashboard (docs/vendor-now.png) leads with 5 notifications before the vendor's own KPIs; zero-state numbers (0 / 0 / 0 / ₦0) with no next step; tabs My Products / Orders / Measurements / Profile; "Shop as buyer" link is a small text link.
- Recommendation: vendor sidebar (see section 3): Overview, Products, Orders, Measurements requests, Payouts, Reviews, Store profile, Help. Overview leads with a to-do list ("Add photos to 2 drafts", "1 order to ship") and KPIs; notifications go to a bell. Onboarding checklist card for new vendors until the first product is approved. Add Payouts and Analytics when the business needs them.
- Effort: M. Impact: Med.

V3. Add/Edit product form.

- Problem (docs/add-product.png): a single long drawer (about 20 fields) with required Name, Short Description, Category, Full Description, Price, Stock; optional Country, Sizes, Tags, SKU, Comparison Price, Variants, Tailoring; image upload is below the fold, broken (BUG-01) and a "Paste URL" workaround exists; the "Who is this for?" and Category fields overlap in meaning with the header category tree (Women/Men/Kids vs. Browse-by-craft categories); the drawer overlays the dashboard so the vendor cannot see page context. No draft saving, no preview.
- Recommendation: convert to a full page with a stepper or collapsible sections: 1 Basics (name, category, gender), 2 Photos (first, required, drag and drop, reorder, min 3, show quality hints: min 1000px, white or neutral background), 3 Details (description with guided prompts, fabric, care, country), 4 Pricing and stock (price, compare-at, variants matrix), 5 Shipping and returns (shipping class, weight, dimensions, processing time, return eligibility), 6 Tailoring/measurements (made-to-order lead time). Live preview card, inline validation, autosave drafts, "Submit for review" disabled

until the checklist (same one admins use) is green. Show status after submission (Draft / In review / Changes requested / Live) and the admin's rejection reason. Remove or heavily constrain "Paste URL" (see S5). Add bulk upload (CSV and multi-photo) later because artisans often have many SKUs.

- Effort: M-L. Impact: High.

V4. Orders and measurements.

- Problem: orders arrive via admin-controlled shipping quotes; vendors see unpaid orders and cancellation notices for orders that were never paid.
- Recommendation: only paid orders reach the vendor; vendor order screen with Accept, Mark ready, Add tracking, Message buyer; for made-to-measure items a measurements request thread with a size guide and deadline, automatically pausing fulfilment until received (the "Requires customer measurements" toggle already exists, make the customer-side prompt very visible in /my-orders and by email).
- Effort: M. Impact: Med.

2.3 Customer and checkout

C1. Account area.

- Problem: /profile and /my-orders are separate pages; /account, /orders, /wishlist, /cart are 404 (BUG-04 notes) and logged-out /profile shows a 404 (BUG-25); no addresses, wishlist, notifications or password change ("Coming Soon").
- Recommendation: a single `/account` hub with a left menu (desktop) or list (mobile): Overview, Orders, Addresses (the checkout already has "Save this address" so a book is implied), Wishlist (heart on product cards), Measurements (saved profiles reused by tailored items), Notifications and preferences, Security (change password, active sessions, delete account/export data for NDPA), Payment/refund info. Keep `/profile` and `/my-orders` as redirects. Redirect logged-out access to `/login?next=/account/orders` and return the user after sign-in.
- Effort: M. Impact: Med-High.

C2. Login and registration.

- Problem: password vs email code both exist, registration uses Turnstile (button disabled until passed; invalid ARIA on the widget BUG-07). No visible password policy, change-password or email verification evidence.
- Recommendation: default to a single email field then offer "Email me a code" or "Use password"; passkeys later. Clear password rules inline (length 10+, check against breached-password list rather than composition rules). Email verification before first order. Rate limit and lock out (see S4). After login return to the page the user came from (add-to-cart intent preserved: the product page has "Sign In to Buy" and "Sign In to Purchase" buttons: two buttons for the same action is confusing, keep one and add "Add to cart" which works for guests with merge on login).
- Effort: M. Impact: Med.

C3. Checkout flow (docs/checkout.png).

- Problems observed:
  - Total shows "Select shipping" instead of a number; the Pay button says "Select shipping method" (disabled) so the customer cannot see a price until choosing among 7 carriers.

  - Seven carriers, all labelled "Rate on request" plus "Est. ₦7,500-9,000"; the blue line "The final carrier price will be requested automatically when you place the order" repeats 7 times. Customers do not know the final price when paying.
  - The orange "Testing mode ... estimated shipping deposit" banner is visible to real shoppers (BUG-17).
  - Order total mismatch: Pay button ₦8,503, My Orders ₦17,003, admin ₦8,503 (BUG-14).
  - Checkout cannot be opened directly or refreshed (BUG-15).
  - Orders appear before payment (BUG-16), and the customer has no cancel button even though "Customer cancelled" events exist.
  - Address form: no phone number visible on the screenshot (needed by carriers and Nigerian couriers), State/Region is a bare select, postal code treated as required-looking though many Nigerian addresses lack it; "Save this address" is okay but there is no address book.
  - Cart badge shows "2" while Order Summary shows 1 line with Qty 2 (fine) but the trust badges (SSL Secure, Tracking, Returns) are decorative and unlinked.
  - Sub-₦ prices: Paystack minimum charge made a ₦1 item unpayable on its own; test data leaks into the live catalogue ("QA TEST - DO NOT BUY").
- Recommendation: see the simplified checkout wireframe in section 3. Principles:
  1. Show a full total up front. Default-select the cheapest suitable method and show "Items + Shipping (estimated) = Total" in the summary before the customer chooses anything.
  2. Compute shipping rather than ask: use destination country + parcel weight/dimensions + vendor origin to show 2-3 relevant options (Express / Standard / Economy), not 7 carriers. Group by "arrives by" date and price. Hide carriers that don't serve the destination (CargoNaija says Nigeria to UK/USA/Canada; show it only for those).
  3. If the final carrier quote is truly needed, choose one of two honest models and label it plainly: (a) "Pay now: items + estimated shipping, we refund any difference or you are never charged more than the estimate plus X%" (recommended), or (b) "Pay for items now, shipping is invoiced within 24h and the order ships after you pay it" using a payment link by email. Avoid wording like "deposit" and "testing estimate".
  4. Create the order only on confirmed payment (Paystack webhook, verified signature, idempotent on reference). Before that, hold a "checkout session" that expires in 30-60 min and keeps the cart intact. Make `/checkout` rehydrate from the cart or session so refresh and bookmark work (BUG-15).
  5. Unpaid orders: if you keep pre-payment orders, show them as "Awaiting payment" with Pay and Cancel buttons, auto-expire after 24-48 h, never alert the admin or vendor, and exclude them from counts.
  6. Cancellation: customer can cancel before the vendor starts processing and before shipment; show refund timeline; after that, link to returns policy. Clear statuses (Awaiting payment, Paid, Awaiting shipping confirmation, Processing, Shipped, Delivered, Cancelled, Refunded) with human labels.
  7. Add a phone field with +234 default and format validation (e.g. 0803... or +234803...), a Nigerian state list, optional postal code, and an inline address autocomplete later. Express checkout for returning users (saved address, Paystack saved card).
  8. Put trust items next to Pay: refund policy, delivery estimate, buyer protection, contact. Remove test banners; if a test mode is needed, gate it on an environment flag and never show it on the

live domain.

9. Confirmation page and email with order number, total, what happens next, how to track, how to cancel.

- Effort: M-L. Impact: High.

C4. Order tracking (docs/my-orders-now.png).

- Problem: tracker shows 4 steps with none active while the badge says "Awaiting Shipping Quote | Pending" (two status chips, neither explains what happens next); "Buy again" is offered on an unpaid order; filters All/Active/Delivered/Cancelled; "Est. delivery 8 Oct 2026" is shown though the quote is not confirmed; total mismatch (BUG-14); help text points to the chat button only.
- Recommendation: one status chip with a plain sentence ("We are getting your final shipping price. You will get an email within 24 hours"), a tracker that highlights the current step, tracking number and carrier link when shipped, order detail page with itemised totals (items, shipping estimate, final shipping, paid, balance), Cancel, Return, Download invoice, contact vendor/support with order pre-filled. Hide "Buy again" for unpaid and cancelled orders.
- Effort: M. Impact: High.

C5. Product page (docs/product-page.png).

- Problem: placeholder image "Product photo unavailable" (BUG-01); price box is good (₦ and "You pay in NGN") but there is no delivery estimate, no seller name/link, no size/colour selector shown, no share, no breadcrumb beyond "Back to Products"; two sign-in buttons for guests; "No verified reviews yet" with no CTA; returns box says "Standard returns accepted" which is vague.
- Recommendation: gallery with 3+ images and zoom; vendor card (name, location, verified badge, response time, link to store page); delivery estimate by destination ("Lagos 2-4 days; International 5-9 days; shipping calculated at checkout"); return policy summary right under the price in 1 line with window and who pays; size guide; "Made to order, ready in 7-10 days" label when tailoring applies; stock urgency only if true; "Add to cart" always visible, plus sticky mobile bar; share (WhatsApp is dominant in Nigeria); structured data (Product/Offer) for SEO; related products.
- Effort: M. Impact: High.

C6. Notifications.

- Recommendation: email plus in-app for order events (payment received, quote ready, shipped, delivered), vendor events, and marketing opt-in separate. Add WhatsApp or SMS for delivery updates later (high usage in Nigeria). Add a preferences page in /account.
- Effort: M. Impact: Med.

2.4 Catalogue and discovery

D1. Long intro blocks push the catalogue below the fold.

- Problem: /products opens with a 9-tile "Browse by craft" section (about 580px at 1366, and most of the first screen on mobile, see docs/rec/m-products.png) followed by a "Made by hand. Rooted in place." editorial block before any product grid; with 0 approved products the grid says "0 pieces" (BUG-01). On mobile the header collapses to logo + hamburger and the home page has no visible search; the category bar shows only 5 items.
- Recommendation: on /products show filters and the grid first (title, result count, sort, filter chips), and move editorial and craft tiles to the home page or to a collapsible "Browse by craft" row (single

horizontal scroller of 9 small circles). Keep one hero. Sticky filter bar; mobile filter bottom-sheet; show active filter chips with Clear all; results count and sort (Newest, Price low-high, Popular); price filter must clamp negatives (BUG-12); URL reflects filters (`/products?category=aso-oke&country=ng&min=5000`) so results are shareable and crawlable.

- Effort: S-M. Impact: High.

D2. Pre-launch empty catalogue.

- Recommendation: until at least ~12 live products, switch the storefront to "Opening soon" mode: hero, vendor sign-up, email waitlist, featured makers/lookbook, "Notify me when X is live". Replace "0 pieces" with an empty state that explains and offers a CTA. Remove all QA products and test orders from production (QA products named "QA TEST ... DO NOT BUY" and ₦1 prices are customer-visible if approved) and use a staging environment.
- Effort: S. Impact: High.

D3. Search and filter UX.

- Problem: search box in header (desktop) but not visible on mobile or on the home page for anonymous users at 375px; long query breaks layout (BUG-02); no autocomplete or "did you mean"; price From/To has no currency indicator or validation.
- Recommendation: header search on mobile (icon expands to a full-width bar), autocomplete with categories/vendors/products, recent searches, zero-results page with suggestions and popular categories, clamp inputs, truncate echoed query with ellipsis. Facets: category, country of origin, price, size, colour, fabric, made-to-order, vendor, rating.
- Effort: M. Impact: Med-High.

D4. Navigation and IA.

- Problem: top nav has 7 to 10 items (Home, Products, Reviews, Events, Collabs, Discover, Policies, Lookbook, Vendor, Admin) plus a second category bar of 9 mega-menus plus "New In" and "Collab Drops" (clipped, BUG-23). Anonymous visitors see a shorter header (Products, Events, Collabs, Policies, About) than logged-in users (inconsistent between pages: home vs product page show different nav sets). Policies in the primary nav is footer content. "Collabs" and "Collab Drops" duplicate each other.
- Recommendation: primary nav: Shop, Collections (Lookbook, Collab Drops), Events, Sell on Afrolandx, plus search, account, cart. Move Policies, About, Reviews to the footer. Keep the category mega-menu only on shop pages or collapse into a single "Shop" mega menu. Role items (Vendor dashboard, Admin) live in the avatar menu. Fix header consistency: same nav on all public pages. On mobile use a drawer with search at top and categories as an accordion.
- Effort: M. Impact: Med.

D5. AI Discover and Lookbook.

- Problem: /discover shows raw JSON to anonymous and "Admin access required" to customers (BUG-22) yet is linked in the main nav for admins and customers alike; /lookbook logged out shows no header at all (BUG-24).
- Recommendation: decide who the audience is. If it is a customer feature, make it work for customers (and clearly label AI), gate with a friendly sign-in prompt, and add a visible disclosure and feedback buttons; if it is an internal tool, move it to the admin Content/Tools group and drop the public nav link. Lookbook should keep the standard header and show a preview before asking for

sign-in. Ensure AI output is moderated and that user inputs sent to a third-party model are disclosed in the privacy policy.
- Effort: S-M. Impact: Med.

D6. Reviews and ratings.

- Problem: /reviews exists and product page says "No verified reviews yet"; no way seen to leave one from /my-orders.
- Recommendation: invite reviews only from delivered orders (verified buyer badge), email 7 days post-delivery with 1-click star rating, photo reviews, vendor replies, admin moderation queue with report button, aggregate rating on cards and in structured data. Show vendor-level ratings and on-time shipping rate.
- Effort: M. Impact: Med.

2.5 Content pages

- Problem: 12 policy pages (/policies/*) are good coverage but are plain pages with a contrast problem (14 axe nodes, BUG-06); /events has a budget number input and "Event Planners" admin tab, but the purpose is unclear from the nav; /reviews/1 and /events/1 show a 404 page with 200 (minor items in the bug report); no About, Contact, FAQ, Size guide or Help centre pages were found, and the only support route is the floating chat button.
- Recommendation: add Contact (email, WhatsApp, hours), FAQ, Size guide, Shipping and delivery times table, "How it works" for buyers and for vendors, About/Our story (trust), and put a short policy summary (returns, shipping, privacy) in the footer. Add a table of contents and "last updated" date on each policy; use plain-language summaries at the top and the legal text below. Keep NDPA-compliant privacy notice with data controller details, DPO contact, retention, and cross-border transfer notice (Paystack, AI vendor, Cloudflare, Google). Footer should also carry business registration (RC number), address, and payment security badges.
- Effort: S-M. Impact: Med.

2.6 Security and privacy

Status of what I could confirm: `GET /` returns `strict-transport-security: max-age=63072000; includeSubDomains` (good, no `preload` token), `x-powered-by: Express` (information leak), `cache-control: private, max-age=0`, `server: Google Frontend` (Google App Engine; the `GAESA` cookie is the affinity cookie), no CSP, no `X-Content-Type-Options`, no `Referrer-Policy` (BUG-10), no `Permissions-Policy`, no frame protection header seen. Session cookie `connect.sid` is Secure/HttpOnly/SameSite=Lax (good).

S1. Security headers.

- Recommendation: add via helmet or at the edge: `Content-Security-Policy` (start with Report-Only, allow self, Paystack, Cloudflare Turnstile, your image host, Google Fonts; no inline scripts if possible, otherwise nonces), `X-Content-Type-Options: nosniff`, `Referrer-Policy: strict-origin-when-cross-origin`, `Permissions-Policy` (disable camera/mic/geolocation unless the Lookbook needs them), `frame-ancestors 'none'` (clickjacking, matters most on admin), `Cross-Origin-Opener-Policy: same-origin`, and remove `X-Powered-By`. Add `preload` to HSTS only after confirming all subdomains are HTTPS, then submit to hstspreload.org. Make `GAESA` Secure if configurable.
- Why: BUG-10, defence in depth for XSS. Effort: S. Impact: Med.

S2. Authorization consistency (BUG-19).

- Problem: another user's existing order returns 500 while a nonexistent order returns 404, leaking which IDs exist and showing the ownership check throwing.
- Recommendation: one `loadOrderForUser(id, user)` helper returning 404 for both missing and not-owned; never 500 for authorization; catch and map errors; use non-sequential public identifiers (UUID or short random order numbers like `AFX-7K3Q9`) so IDs cannot be enumerated (orders are #19, #20, #27, i.e. guessable and they reveal business volume). Add automated tests asserting each role against each endpoint (the access-matrix.json can seed this).
- Effort: S. Impact: Med-High.

S3. Public API data exposure.

- Problem: public product API returns internal `clientImportKey` and `vendorId`.
- Recommendation: serialise through an explicit allow-list DTO (id/slug, name, price, images, vendor display name/slug); never send raw DB rows; review other public endpoints (vendors, reviews, events) with the same lens; remove PII from admin lists unless needed.
- Effort: S. Impact: Med.

S4. Authentication hardening.

- Recommendation: rate limit and progressive lockout per IP and per account on password login, email-code request (e.g. max 5 codes/hour/email) and code verification (max 5 attempts per code, 10 min expiry, single use, 6+ digits); generic error messages ("If this email exists..."); Turnstile also on login and on code request after failures (currently only registration); session ID rotation on login; invalidate sessions on password change; implement change password and password reset (currently "Coming Soon"), with email notice; email verification; CSRF: SameSite=Lax cookies help, but add CSRF tokens or `Origin` header checks on all state-changing requests (Express with cookie sessions is vulnerable otherwise from same-site subdomains and top-level navigations on Lax POST edge cases); consider `__Host-` cookie prefix. Anonymous 401s on /api/auth/user and /api/cart (BUG-13): return `200 {user:null}` to cut noise and avoid brute-force-looking traffic in logs.
- Effort: M. Impact: High.

S5. Image upload and "Paste URL".

- Problem: images go to a storage backend that is down (503); the workaround stores an external URL typed by the vendor (product 12 displays "Product photo unavailable" because the URL is dead or blocked). Risks: server-side fetching of arbitrary URLs (SSRF to metadata server at 169.254.169.254 on Google Cloud, internal hosts), hotlinking that can swap content after approval (a vendor can change the image after the admin approved it), tracking pixels, mixed content, and inappropriate content.
- Recommendation: if the server fetches the URL, do it only through an allow-listed fetcher: https only, resolve DNS and block private/link-local/loopback ranges, no redirects to private IPs, size cap (5-10 MB), timeout, content-type sniffing, re-encode (strip EXIF/GPS) and store in your own bucket; then serve only your own CDN URLs. If the browser loads the URL directly, remove that option. For uploads: allow jpeg/png/webp only, verify magic bytes, cap dimensions and size, randomise filenames, store outside web root, serve from a separate domain with `X-Content-Type-Options: nosniff`, optionally malware-scan, and generate thumbnails. Monitor storage health and show vendors a clear error with retry. Re-review images when edited after approval.

- Effort: M. Impact: High.

S6. Payments and order integrity.

- Problem: Clicking Pay creates the order and the "Pay" amount (₦8,503) differs from the customer-visible total (₦17,003) (BUG-14, BUG-16). The amount charged appears to be computed from a client or server estimate.
- Recommendation: compute all amounts server-side only (ignore client-sent totals); store a price snapshot on the order (items, shipping estimate, fees, currency); verify Paystack events with HMAC (`x-paystack-signature`), verify via the Transaction Verify API that amount, currency and reference match the order before marking paid; make webhook handling idempotent (unique constraint on reference, process once); handle underpayment, duplicate, expired and failed payments; reconcile daily with Paystack settlements; store only the Paystack reference (never card data); a clear refund flow tracked in the admin. Confirm Paystack live vs test mode status (BUG report leaves it undetermined): ensure live keys are used only server-side and test keys never on the live domain.
- Effort: M. Impact: High.

S7. Input validation and abuse.

- Recommendation: server-side validation (zod/joi) for every endpoint: numeric ranges (price > 0 and below a cap, stock integer >= 0, negative values rejected, BUG-12), string lengths, enum checks, HTML escaping/sanitisation of vendor descriptions (stored XSS vector in product pages, reviews, chat), file upload checks, pagination caps; limit chat widget message length and rate; bot protection (Turnstile) on public forms like chat and contact; global per-IP rate limit at the edge (Cloudflare WAF rules).
- Effort: M. Impact: High.

S8. Privacy, consent and NDPA.

- Problem: no cookie or consent banner seen; /policies/privacy-and-cookies exists; the site sets a load balancer cookie and likely analytics/chat cookies; collects CAC numbers, IDs, addresses, phone numbers and body measurements (sensitive personal data in practice).
- Recommendation (Nigeria Data Protection Act 2023): lawful basis per purpose, a consent banner with Accept / Reject / Manage that does not load non-essential trackers before consent, privacy notice naming the controller and listing processors, data subject rights (access, correction, deletion, portability) through an in-account "Download my data" and "Delete my account" flow, retention schedule (e.g. abandoned carts, KYC documents, measurements), breach response plan (NDPC notification within 72 hours), a Data Protection Officer contact, and a cross-border transfer disclosure. Encrypt KYC documents at rest and restrict access to verifiers; mask CAC/ID numbers in the UI; log access. Consider registering with NDPC if thresholds apply (confirm with counsel).
- Effort: M. Impact: Med-High.

S9. Secrets, backups, monitoring.

- Recommendation: all keys in Secret Manager (no secrets found in bundles, good); rotate Paystack and email keys; separate prod/staging with separate keys and databases; enforce least-privilege service accounts; dependency scanning (npm audit/Dependabot) and a pinned Node runtime; automated daily database backups with tested restore and point-in-time recovery; uptime and error monitoring (Sentry, Cloud Logging alerts for 5xx spikes, payment webhook failures, upload failures like BUG-01 which silently blocked the whole store); an admin "System Overview" health panel (storage, payments, email, queue) with alerting.

- Effort: M. Impact: High.

2.7 Design system and accessibility

X1. Icon-only buttons have no accessible names (BUG-05).
Add `aria-label` to the chat button (the floating button appears on every page and overlaps content such as "Refresh Now" in docs/admin-now.png and the vendor stat cards), notification close X buttons, carousel arrows and the pause button, cart and avatar. Effort S, impact High (compliance and screen-reader users).

X2. Contrast and brand colour (BUG-06).
Gold (`.text-nigerian-gold`) on beige and the "Collab" item in the category bar are low contrast; the green hero text on a patterned overlay (docs/baselines/anonymous/home.png) is readable but the pale-yellow headline over a busy photo relies on the overlay. Define tokens: darken gold for text (e.g. a deep amber about #8A6100 on cream for body-size text) and keep bright gold for backgrounds/borders only; target 4.5:1 for text and 3:1 for UI; test with axe in CI. Effort S, impact Med.

X3. Consistency issues seen.

- Empty white rounded box in the header next to the cart (BUG-18), on every logged-in page.
- Three different heading styles: serif-like display "Browse by craft", sans admin headers in red (Admin Dashboard in red reads as an error state; use neutral or brand colour and reserve red for danger), and bold black on checkout.
- Currency glyph: ₦ is rendered with a heavy stroke in KPI cards ("₦0") and looks like "N0"/"₦O" at a glance; confirm font support and use tabular numerals with a thin space; format with `Intl.NumberFormat('en-NG', {style:'currency', currency:'NGN'})` everywhere (and show kobo only when non-zero).
- Raw enum text in the UI (`awaiting_shipping_quote`, `Awaiting_shipping_quote`) in admin alerts and orders: use a label map.
- Status chips: "Pending" and "Awaiting Shipping Quote" side by side on the same order with different meanings; show one.
- Dismiss X buttons on notifications with no undo; the dashboard states "Refresh" in two places (auto-refresh every 30s plus button) fine, but show a skeleton or subtle spinner rather than layout shift. Recommendation: document a small design system (tokens for colour, spacing 4/8px scale, type scale, radius, shadow), a shared Button/Chip/Alert/Dialog/Drawer/Table/Empty-state component set, a single toast style with success/error/info, skeleton loaders for lists and product grids, and a dialog pattern with focus trap, Esc to close, and return focus. Effort M, impact Med.

X4. Mobile (docs/rec/m-home.png, m-products.png).

- Header: logo + hamburger only; no cart, search or sign-in visible on mobile home. Put cart and search icons next to the hamburger.
- Hero fills the full screen height (about 1000px of 2000 in the screenshot) with 9 carousel dots, an auto-playing slider (keep the pause button, but default to no autoplay for reduced motion) and the chat bubble over the dots. The body is about 14,000px tall at 375px. Trim to one hero plus a product row.
- Tap targets: carousel dots are small; ensure at least 44px targets.
- Category bar: a horizontal scroller without affordance (no fade or arrow); ok, but add a fade edge.

- Chat bubble overlaps the cart/checkout CTA at the bottom of pages; hide it on checkout or offset it above sticky bars.
  Effort S-M, impact Med-High (most Nigerian e-commerce traffic is mobile).

X5. Keyboard and focus.
Add visible focus rings on all interactive elements (the Add Product drawer shows a strong focus ring on the first field, good, replicate everywhere), skip-to-content link, `aria-live` for toasts, label every form input (the Security check widget ARIA, BUG-07, should be fixed or replaced with the official Turnstile mount), `lang="en-NG"`, `prefers-reduced-motion` for the carousel, and aria-current on active nav items. Run axe in CI against 10 key pages. Effort S-M, impact Med.

X6. Copy and localisation.

- Tone: brand voice is warm on the home page, technical in admin/checkout ("server-generated testing estimate", "preserved historical records", "Initialise categories", "Actual Orders"). Replace with plain language: "Estimated shipping", "Older orders (kept for records)", "Set up categories".
- Nigerian conventions: NGN with ₦ and thousands separators (₦17,003), dates as "5 Oct 2026" (the vendor notifications use DD/MM/YYYY while orders use "5 October 2026": pick one), phone input with +234 and 0-prefix handling, state dropdown with all 36 states + FCT and LGA optional, landmark/"nearest bus stop" address hint, delivery times phrased by city; support pay-with-transfer/USSD options through Paystack, WhatsApp support link.
- Trust: show vendor verification badge ("CAC verified"), return policy near price, delivery estimate, secure payment logos, real contact details, review counts, "As seen in" only when true.
- Dark patterns: none egregious found. Watch out for urgency messages ("only 3 in stock" is fine if real) and the deceptive "Rate on request" repeated seven times; hidden deposits (see C3) would count as a drip-pricing practice and may conflict with Nigerian consumer-protection (FCCPC) expectations on price transparency.
- Effort: S. Impact: Med.

2.8 SEO and performance

E1. Metadata and crawlability (BUG-08, 09, 20, 21, 03, 26).

- Recommendation: unique `<title>` and `<meta name="description">` per route ("Aso Oke Agbada by [Maker] | Afrolandx"), canonical, Open Graph and Twitter cards (images for WhatsApp previews), JSON-LD (Organization, Product, BreadcrumbList, Review), `robots.txt` (allow public, disallow /admin, /api, /checkout, /my-orders, /profile, /vendor), `sitemap.xml` generated from approved products/categories, `manifest.json` or remove the link, slug-based URLs with a 301 from `/products/12` to `/products/12-aso-oke-agbada`, lowercase redirect for `/Products/12` and trailing slash normalisation, `noindex` on filtered/search URLs, real 404/410 status for unknown routes and API paths, prerender or SSR for home, categories, product and policy pages (Next.js or a prerender service). Product pages must render content without JS for crawlers.
- Effort: M-L. Impact: High.

E2. Performance (BUG-11).

- Recommendation: LCP 3.3-3.6 s: serve the hero as a single optimised AVIF/WebP with `fetchpriority=high` and explicit dimensions, lazy-load the other 8 carousel slides (load slide 2 on interaction), responsive `srcset`, serve images from a CDN with long cache headers (HTML is `private, max-age=0` which is fine, but static assets need immutable caching), preconnect to

fonts/Paystack, preload critical font, split JS bundles by route (admin code should not ship to customers), compress (Brotli), reduce the 401 console noise. Add skeleton loaders for the grid so the page does not look empty while loading. Track Core Web Vitals in the field (web-vitals to analytics). Target LCP under 2.5 s on 4G mid-range Android.

- Effort: M. Impact: Med.

2.9 Operations and monitoring

- **O1. Environments and test data.** Production holds QA products and orders (#27, "QA TEST" vendor and a ₦1 product that Paystack cannot even charge). Create a staging site with Paystack test keys, then purge test data from production and add a visible-to-admin-only "test" flag if needed. Effort S, impact Med.
- **O2. Admin KPIs.** Dashboard shows contradictory numbers (₦0 revenue / 0 paid orders at top vs ₦8,503 actual revenue on the Orders tab; "Fulfilment Rate 0%" with "0 live products"). Define metrics once (paid revenue, GMV, orders by status, average quote time, approval time, vendor activation rate) and show a date range. Effort M, impact Med.
- **O3. Support.** Chat widget is the only support channel; there is no ticket history. Add contact form with order number, SLA, email reply, and escalate chat to a shared inbox; show business hours; log chat to admin. Not tested in depth: chat behaviour. Effort M, impact Med.
- **O4. Alerting and runbooks.** Alerts for upload failures, payment webhook errors, 5xx, slow responses, stuck orders, and expiring TLS; incident contacts; weekly backup restore test. Effort M, impact High.
- **O5. Status codes and logging.** Return proper status codes (BUG-03, 19, 20, 26), request IDs in error pages, structured logs without PII or card data, retention policy. Effort S, impact Med.

3. Proposed information architecture

3.1 Sitemaps per role

```
PUBLIC / ANONYMOUS
/                          Home (one hero, featured makers, new in, categories)
/shop                      Catalogue (alias /products): filters + grid first
/shop/{category}           e.g. /shop/aso-oke, /shop/women
/country/{code}            e.g. /country/ng (By Country)
/products/{slug}-{id}      Product page (301 from /products/12)
/vendors/{slug}            Maker/store page
/collections/lookbook      Lookbook (public preview)
/collab-drops, /events     Campaigns and events
/search?q=                 Search results (noindex)
/reviews                   Community reviews
/help                      FAQ, size guide, shipping, contact
/policies/{slug}           12 existing policy pages
/login, /register          Auth (with ?next= return)
/sell                      Become a vendor (info + apply)
/cart (drawer + page)      Cart page for sharing/refresh

CUSTOMER (/account)
/account                   Overview (orders in progress, saved items)
/account/orders            Orders list
/account/orders/{ref}      Order detail, track, cancel, return, invoice
/account/addresses         Address book
/account/wishlist          Saved items
/account/measurements      Saved measurement profiles
/account/notifications     Inbox + preferences
/account/security          Password, sessions, MFA (optional), delete/export data
/checkout                  Rehydrated from cart/session (refresh-safe)
/checkout/confirmed/{ref}  Confirmation

VENDOR (/vendor)
/vendor/apply              Application stepper
/vendor/status             Verification status page
/vendor                    Overview (to-do, KPIs)
/vendor/products           List; /vendor/products/new; /vendor/products/{id}/edit
/vendor/orders             Orders to fulfil; /vendor/orders/{ref}
/vendor/measurements       Customer measurement requests
/vendor/payouts            Balance, payout history
/vendor/reviews            Reviews and replies
/vendor/store              Store profile, policies, shipping settings
/vendor/help               Guides, support

ADMIN (separate host admin.afrolandx.com, or unlisted path)
/                          Dashboard (needs-attention queue, KPIs)
/orders, /orders/{ref}     Operations
/quotes                    Shipping quotes (aging, templates)
/returns                   Returns and refunds (future)
/payments                  Payments, payouts, reconciliation (future)
/approvals/products        Product approvals
/featured                  Featured products
/categories                Category management
/vendors, /vendors/{id}    Applications, verification, approval
/users, /users/{id}        Customers and staff
/event-planners
/content/reviews, /content/pages, /content/lookbook, /content/collabs
/system/overview           Health
/system/audit-log
/system/roles              Roles and permissions
/system/settings
```

3.2 URL scheme notes

- Slugs: `/products/aso-oke-agbada-set-12` (slug is cosmetic, id is authoritative, redirect when slug is stale); lowercase only; no trailing slash; canonical tag on every page.

- Order references: random, non-sequential (`AFX-7K3Q9`), never `/orders/27`.
- Admin entry: `https://admin.afrolandx.com/` with its own login, session cookie scope limited to that host, optional Cloudflare Access in front; `afrolandx.com/admin` returns the standard 404 (or 301 to the admin host only for already authenticated staff, not publicly).
- Redirect logged-out account/checkout routes to `/login?next=...`; unknown routes return 404 status with the branded page.

3.3 Admin sidebar wireframe (desktop, 1366px)

```
+-------------------------------------------------------------------------------+
| [Logo] Afrolandx Admin      [ Search or jump to... Ctrl+K ]   (bell 3) [CN v]  |
+----------------+--------------------------------------------------------------+
| Dashboard      |  Home > Operations > Shipping Quotes                         |
|                |  Shipping Quotes                          [Templates] [Export]|
| OPERATIONS     |  [All 11] [Waiting >24h 4] [Overdue 2]   Filters: Carrier v   |
|  Orders     12 |                                                 Saved: Overdue |
|  Quotes     11 |  +-----------------------------------------------------------+ |

| PEOPLE         |                                                               |
|  Vendors     1 |                                                               |
|  Users         |                                                               |
|  Planners      |                                                               |
| CONTENT        |                                                               |
|  Reviews     0 |                                                               |
|  Pages         |                                                               |
|  Lookbook      |                                                               |
| SYSTEM         |                                                               |
|  Health        |                                                               |
|  Audit log     |                                                               |
|  Roles         |                                                               |
|  Settings      |                                                               |
| [<< collapse]  |   (mobile: sidebar becomes a hamburger drawer; tables -> cards) |
+----------------+--------------------------------------------------------------+
```

Vendor sidebar uses the same pattern with 6-7 items (Overview, Products, Orders, Measurements, Payouts, Reviews, Store). The customer /account hub uses a left list of 7 links on desktop and a stacked list with chevrons on mobile.

3.4 Simplified checkout wireframe

```
CHECKOUT (single page, refresh-safe)                        Secure checkout (lock)
+-----------------------------------------+  +--------------------------------+
| 1. Contact and delivery                 |  | Order summary                  |
|    Email (from account)                 |  |  [img] Product name   x2  N..  |
|    Full name        Phone (+234 ...)    |  |  Subtotal                  N..  |
|    Saved address v  or  Add new:        |  |  Shipping (estimated)     N..  |
|    Address, City, State (36+FCT), Postal|  |  --------------------------    |
|    optional, Country                    |  |  TOTAL                     N..  |
|    [x] Save to my address book          |  |  You will pay N.. today.        |
|                                         |  |  Shipping is confirmed within   |
| 2. Delivery (2-3 options, cheapest first)  |  24h; any difference is         |
|    (o) Standard  3-5 days    ~N7,500    |  |  refunded. (link: how it works)|
|    ( ) Express   1-3 days    ~N8,500    |  |                                 |
|    Arrives by Thu 9 Oct - Sat 11 Oct    |  |  [ Pay N.. with Paystack ]      |
|                                         |  |  Returns policy | Buyer         |
| 3. Payment                              |  |  protection | Contact           |
|    Paystack: card, transfer, USSD       |  |  Edit cart                      |
+-----------------------------------------+  +--------------------------------+
Mobile: summary collapses to a sticky bar ("Total N.. v") above the Pay button.
```

4. Phased roadmap

Now (security and launch blockers, about 2-4 weeks)

1. Restore image storage (BUG-01), add monitoring so it cannot fail silently, remove or constrain "Paste URL", add upload validation (S5).
2. Seed real products, remove QA data, add "opening soon" fallback (D2, O1).
3. Order and payment integrity: single server-side total, pay-then-create order or expiring unpaid orders, webhook signature and idempotency, remove testing banner, fix checkout refresh (BUG-14, 15, 16, 17; S6, C3 minimum).
4. Security headers, `X-Powered-By` removal, 403/404 consistency and non-guessable order refs, public API allow-list, 404 status codes, robots.txt/sitemap (BUG-10, 19, 20, 03, 26; S1-S3).
5. Admin hardening quick wins: hide Admin/Vendor/Discover links from non-privileged users, MFA for admins, shorter admin sessions, 404 for non-admins on admin routes, audit log table behind the existing banner claim (A1).
6. Rate limiting and lockout on login and email-code (S4); cookie consent basic banner (S8).
7. Accessibility quick fixes: button names, contrast, header box, clipped nav item (BUG-05, 06, 18, 23).

Next (UX and workflow, about 1-3 months)

1. Admin sidebar shell, notification bell, approval and quote queues with SLA/aging/bulk (A2-A5).
2. Checkout redesign with computed shipping options and honest total; customer cancel flow; order detail page; email notifications (C3, C4, C6).
3. /account hub, address book, change password and reset, wishlist (C1, C2).
4. Vendor onboarding stepper and status page; product form as stepper with autosave and review checklist; vendor sidebar (V1-V3).
5. Catalogue-first /products layout, search on mobile, filters in URL, empty states (D1, D3).
6. SEO foundation: per-page meta, canonical, slugs, prerendering, structured data (E1).
7. Separate admin host with Zero Trust/IP allow-list option and role/permission model (A1 phase 2).
8. Reviews from verified buyers and moderation (D6).

Later (scale and polish, 3-6+ months)

1. Carrier rate-API integration for automatic shipping quotes; returns and refunds workflow; vendor payouts and reconciliation.
2. Design system documentation and component library; dark-mode optional; localisation (Yoruba/Igbo/Hausa, French for francophone Africa) and multi-currency display with NGN charge.
3. Passkeys, device management, advanced fraud rules, WAF tuning.
4. Performance budget in CI, Core Web Vitals monitoring, image CDN, SSR/edge caching.
5. AI Discover/Lookbook product decision, vendor analytics, promotions, loyalty, WhatsApp/SMS notifications, bulk product import, vendor storefront pages.
6. Formal DR drills, penetration test, ISO 27001-style policy set if enterprise vendors are targeted.

---

5. Open questions for the owner

1. Shipping model: is a carrier quote truly required per order, or can shipping be priced from weight/destination tables for most orders? Which model do you prefer for the difference (refund vs. invoice later)? What is the intended total in BUG-14 (₦8,503 or ₦17,003)?
2. Should unpaid orders exist at all? If yes, how long should they stay open (suggest 24-48 h), and should vendors or admins ever be alerted for them?
3. Who are the real admin staff and how many? Do you want an admin subdomain, a Cloudflare Access/IP allow-list, and which MFA method (authenticator app, passkey, email code)? What does the "verified superadmin" permission cover today?
4. Is the shared customer+admin+vendor account a test convenience only? Can staff use dedicated admin identities?
5. What is the image storage backend (cloud bucket, third-party), why is it returning 503, and who monitors it? Is the "Paste URL" path meant to stay (and does the server fetch the URL)?
6. Is Paystack in live or test mode on production, and where are webhooks verified?
7. Who is the audience for Discover and AI Lookbook (customers, vendors, staff), which AI provider receives user input, and is that disclosed?
8. Target launch date and minimum catalogue size; are you willing to run in "opening soon" mode until then?
9. Expected vendor count and approval SLA; can verification and final approval be one step for low-risk vendors? Which documents beyond the CAC number are collected and where are they stored?
10. Which markets matter first (Nigeria only, or UK/US diaspora shipping)? This drives currency display, tax/duty messaging and carrier choices.
11. Data protection: who is the data controller/DPO, are you registered with the NDPC, and which analytics or marketing trackers (if any) are loaded?
12. Is SSR/prerendering acceptable in the current stack (React SPA on Express, hosted on Google App Engine), or should marketing/SEO pages live on a separate static/CMS front end?
13. Do you want customer reviews limited to verified purchasers, and who moderates them?
14. Support: who answers the chat, in what hours, and should WhatsApp be the primary channel?

SECOND PASS (2026-10-05): live walk of the previously skipped areas

This section was added after a second, live, read-only walk. It **supersedes the "not re-walked" caveat in the Scope section above** for everything listed here. Scripts: `utils/rec-admin.ts`, `rec-admin2.ts`, `rec-vendor.ts`, `rec-public.ts`, `rec-m-checkout.ts`, `rec-policies*.ts`. Screenshots: `docs/rec/` (prefix `d-` desktop 1366px, `m-` mobile 375px / Pixel 7). Every script logged non-GET requests: **none were made** (no forms submitted, no AI called, no code requested, nothing approved or deleted). Dialogs (vendor review, create product for vendor, bulk, add product) were opened to read and closed with Escape. Personal data seen on screen is not reproduced here.

Security marking: **TESTED** = observed on the live site with a read-only request; **INFERRED** = deduced from behaviour or UI, not probed; **NOT TESTED** = not examined.

New bugs found (BUG-27 onward)

ID	Where	One-line repro	Sev
BUG-27	Admin > Vendors > Review (a vendor with status "approved")	Open Review: VERIFICATION = pending, "CAC number: Not provided", verification checkboxes unticked, yet status is approved. The documented gate (CAC + manual verification + superadmin approval) is not enforced.	**High**
BUG-28	Admin > Shipping Quotes	**CORRECTED after verification: not a bug as first written.** The "25000" and "5-7 business days" are grey placeholder hints; all 11 cards have an empty value (checked: `placeholder="25000" value=""` on 11 of 11). A "Confirm quote" click with empty fields is not a pre-filled commit. Remaining Low issue: a realistic number as a placeholder can be mistaken for a real value, so use a neutral hint such as "Enter rate in ₦".	**Low**
BUG-29	Admin > Shipping Quotes	10 quote requests (#1-#10) still "pending", oldest about a month old (2 Sept); list is not sorted by age and has no aging flag. Request #11 shows "0.00 kg recorded", so weight-based quoting has no data.	**High (ops)**
BUG-30	Admin > Analytics	Low-stock row reads "undefined left"; Vendor Rankings reads "N31 products" (currency sign on a count); "Orders by Status" is 0 in every state although orders exist; "Orders by Country" shows only Nigeria although quotes exist for South Africa. Top banner "N0 revenue / 0 paid orders" contradicts the Orders tab "N8,503 Actual Revenue" (extends BUG-14).	**Med**
BUG-31	Mobile 375px: Admin > Vendors (scrollWidth 566), Admin > Users (551), vendor dashboard all tabs (388), /checkout (412)	Open each at 375px: horizontal scroll; Review/Suspend buttons run off the card. Extends BUG-02 to normal use.	**Med**
BUG-32	Mobile /checkout	Page is about 8,900px tall; Order Summary, Total and the disabled Pay button are at the very bottom, after 8 carrier cards and the Paystack box.	**Med**
BUG-33	Return Policy vs /my-orders	Policy says "Start a return through the order page"; /my-orders has no Return or Cancel action (see BUG-16).	**Med**
BUG-34	/checkout	No phone field; address inputs have no `autocomplete` attributes, so mobile autofill does not work.	**Med**

ID	Where	One-line repro	Sev
BUG-35	Vendor dashboard	Recent Notifications include "New shipping quote request ... [customer first name] placed an order ..." and "Order #19/#20 needs attention", which are platform-level events. INFERRED: the test account has admin + vendor roles so this may be role bleed; verify with a vendor-only account that vendors never see other customers' orders.	**Med (privacy, verify)**
BUG-36	/discover (admin preview)	"1 cities" (no plural); hard-coded promo content ("Save up to 40%", "Reach 50K+ travellers", "Promoted by Nigeria Tourism", discount deal cards) with active "Book" buttons while the banner says bookings and payments are disabled.	**Med**
BUG-37	Cart drawer	"Proceed to Checkout" matched 2 buttons in the DOM (duplicate element); cart line has no product image and a truncated name; "Clear cart" is a large red full-width button directly under the item (accidental tap risk; not clicked).	**Low**
BUG-38	Admin > Users	**RESOLVED (seen 2026-10-07).** The tab is now "Customers and vendors" and each row has "View details", which offers only "Review vendor application" and "Close"; the always-visible "Delete unused" buttons are gone. Original report: every row had a red "Delete unused" button with no confirmation tested.	Resolved
BUG-39	GET /api/products (anonymous)	Besides `clientImportKey` and `vendorId`, the public JSON exposes `sku`, `status`, `weight`, `dimensions`, `createdAt/updatedAt`, `metaTitle`, `returnPolicy`. TESTED.	**Low-Med**
BUG-40	All responses	`X-Powered-By: Express` on pages and /api; HSTS without `preload`; `GET /admin` returns 200 with the app shell to anonymous users (only data APIs answer 401). TESTED.	**Low**

S1. Admin tabs, live (desktop 1366 and mobile 375)

Evidence: `docs/rec/d-admin-*.png`, `m-admin-*.png`, `m-admin-top.png`.

Reviews. Pending-review queue with count, Refresh and a clean empty state. No filters, no reported or published views, no vendor replies. Recommend tabs Pending / Published / Reported / Hidden, keyword flagging, moderation reason templates, link to the order. Effort M, impact Med.

Product Approvals (`d-admin-product-approvals.png`). Better than I first assumed: pagination ("Showing 1-1 of 1, up to 50"), "Select this page's products", bulk "Approve selected (n)", per-row Approve / Reject and an eye+chevron preview, plus "Create Product for Vendor". Gaps: (a) bulk Approve has no visible safeguards (it must skip rows failing the image check, BUG-01, and report per-row results); (b) no bulk Reject and no reason field on the row; (c) the row shows name, price, stock, vendor, category but no photo thumbnail (blank image slot), no checklist; (d) "Create Product for Vendor" sits above the queue, mixing "work the queue" with "create content"; its dialog ("photos are automatically corrected and optimised", "0 of 5 photos selected", "Create Draft & Notify Vendor") is a useful concierge feature but admin-authored drafts should be audit-logged and need vendor consent. Recommend: thumbnail plus checklist chips (Photo, Price, Description, Category, Shipping class), Approve disabled with a reason when a blocker exists, Reject with reason templates, a "Changes requested" state, an age/SLA column (vendors are promised 24h), move "Create Product" into a "+ New" menu. Effort M, impact High.

Shipping Quotes (`d-admin-shipping-quotes.png`). Each quote is a full card: carrier, status, request number, requester, address, item count, weight, time, cart snapshot, and four fields (Confirmed rate, Delivery estimate, Validity days, Notes) with Reject request / Confirm quote. Good: the subtitle states

"Buyers can pay only an unexpired quote linked to an unchanged cart and shipping address". Problems: BUG-28, BUG-29, 11 tall cards in about 4,900px, repeated requests from the same requester (likely retries, so deduplicate), missing weights, non-Nigerian destinations quoted with a Nigerian template, no carrier link or copy action. Recommend: collapsed one-line rows (carrier, route, weight, cart value, age) that expand; oldest first with red/amber/green age chips; empty fields plus a computed hint ("DHL zone 4, 2.8 kg"); a rate-card table in Settings; confirm warning when the rate deviates from the hint; automatic reminders and auto-expiry with customer notice; emails on confirm/reject (whether they are sent: NOT TESTED). INFERRED: confirming a quote is money-affecting, so require step-up auth and log before/after values. Effort M, impact High.

Featured Products. "Featured Slots Used 0 / 8" and a "Recommended to Feature" list ranked by "inventory value and availability". Ranking by stock value rewards stock not quality; no slot ordering, scheduling or homepage preview. Recommend drag-to-order, schedule, rank by sales velocity/rating/image quality, "Preview on home". Effort S-M, impact Med.

Vendors (`d-admin-vendors.png`, `d-admin-vendor-review.png`). Four vendors (approved, suspended, approved, rejected) with Review plus Suspend/Reactivate; no search, filters or pagination. The Review dialog is the best-designed admin screen: account owner, email verified, a CAC step with "Open official CAC Public Search ... a manual review, not an automatic CAC lookup", registered name, listing status (Active / Not active / Number not found), three attestation checkboxes, "Record verification", notes, "Reject verification", a compliance checklist (business name, description 10+ chars, owner name, valid email, email verified), then Suspend Vendor. Gaps: BUG-27 (status and verification disagree); no evidence upload (CAC result screenshot, ID); no verifier identity or timestamp shown; Suspend and Reject sit beside Close (confirmation NOT TESTED). Recommend one status model (Applied -> Verification in progress -> Verified -> Approved -> Suspended/Rejected) where Approve is disabled until Verified; two-person rule (verifier is not approver); record verifier and time; evidence snapshot; last-activity and product counts; search and filters; mobile cards that wrap actions (BUG-31). Effort M, impact High.

Users (`d-admin-users.png`). Flat list of 10 with role chips (customer / admin / vendor / superadmin), "Show closed accounts (0)", and the note "Only verified superadmins can change account roles." See BUG-38. No search, role filter, last login, lock status, MFA flag, order count or detail page; full emails shown to all admins. Recommend search and filters, a user drawer with timeline, roles, sessions and orders as the only home of delete/close (a "Danger zone" with typed confirmation, reason, soft delete with retention, audit entry), lock/unlock and force-logout, "last login" and "MFA enabled" columns, role changes behind step-up auth and dual approval, at least two superadmins. Effort M, impact High.

Event Planners. "Only verified superadmins can approve, suspend, or reject event planners." Empty, with a "Completed event commission records" heading. Define commission terms and planner verification (same pattern as vendors) before opening applications. Effort S, impact Low today.

Discover (admin tab). KPI tiles (Total, Pending Review, Approved, Premium Subscriptions, all 0) for "guide registrations, business claims, deal listings and destination features". This is a second business (travel guide and deals) inside a fashion marketplace admin. Decide whether it is in scope for launch; if not remove the tab and nav link; if yes give it its own Content > Discover section and moderation rules. Effort S, impact Med.

System Overview. Cards: Active Vendors 2 / 4, Approved Products 1 / 1, Featured Slots 0 / 8, Verified Users 9 / 10, Inventory Value, Top Products, Low Stock, and Quick Actions (Review Pending Products, Review Vendor Applications, View Analytics, Manage Featured, **Initialise Categories**, **Export All**

Orders (CSV)). Despite the name it is business metrics, with no service-health cards (storage, payments webhook, email, DB, backups), exactly what failed silently in BUG-01. Recommend: rename to "Overview" and add a "System health" panel with green/amber/red checks and alerts. "Export All Orders (CSV)" is a one-click bulk PII export: require step-up auth, an audit entry, date range and column limits. Effort M, impact High.

Notifications panel. Four full-width red cards pinned above the KPIs and tabs on every admin tab, so work starts about 830px down on desktop and the 4th card is still partly on screen at the bottom of an 812px phone (`m-admin-top.png`). No "mark all read", no timestamps on the admin version (vendor version has dates), no deep links, the same two orders re-announced ("738 hours", about 31 days, a one-shot figure that never refreshes). Recommend the bell and drawer from A3, timestamps, deep links, auto-resolve. Effort S-M, impact Med.

"Initialise categories" button (dashboard header, top right beside the status badges; duplicated in System Overview > Quick Actions). NOT clicked. It is a setup/seed action with an ambiguous verb in the most prominent spot of every admin tab, styled like a normal secondary button. Risk: if it re-seeds it could overwrite renamed categories, break product-to-category links or create duplicates; an accidental tap on mobile is plausible (it sits at thumb height, `m-admin-top.png`). Recommend: remove from the header; keep under System > Maintenance as "Re-seed default categories", superadmin only, disabled once categories exist, with a dry-run summary ("will create 3, will not change 9") and typed confirmation; make it idempotent; log it. Effort S, impact Med.

Admin on mobile (375px). The 11 tabs wrap into about 5 rows; header, badges and "Initialise categories" wrap to 3 rows; Vendors and Users overflow horizontally (BUG-31); the chat bubble covers the first action of vendor rows. Recommend off-canvas sidebar, card tables with a single actions menu, and no chat bubble on admin pages. Effort M, impact Med.

S2. Vendor area, live

Evidence: `d-vendor-*.png`, `m-vendor-*.png`, `d-cust-vendor.png`, `d-vendor-add.png`, `d-vendor-add-bottom.png`, `d-vendor-bulk.png`.

Dashboard and tabs. Tabs My Products / Orders / Measurements / Profile; stats (Total Products, Approved, Pending, Total Value). My Products lists each product with a status chip (Live / Under Review), the hint "Awaiting administrator approval, usually within 24 hours", Edit and Delete side by side, and a "No image" slot on the Live product. Orders and Measurements are friendly empty states. Profile shows Contact Name, Business Name, Description, Phone, CAC number, Status, with Edit. Observations: a Live product with no image is allowed (BUG-01 link); delete confirmation NOT TESTED; notifications take about 570px before the vendor's own numbers (BUG-35 too); no sales/views/payout figures; Profile lacks verification status, payout details and store policies. Recommend: KPIs and to-do first, notifications behind a bell; a status banner (Applied / Verified / Approved) until fully approved; "Archive" instead of Delete, blocked when in open orders; a product health chip per row (Missing photo, Low stock); a Payouts tab (the Vendor Orders/Shipping/Returns/Settlement policy already exists, so expose it); legal name or CAC edits re-trigger verification. Effort M, impact Med-High.

Add Product drawer (about 20 controls). Order: Name*, Short description*, Category* (9 options), Who is it for, Country of origin (54 countries, optional), Available sizes (8 sizing systems), Full description*, Tags, SKU, Price*, Comparison price, Total stock*, Variants, Tailoring & fulfilment (Requires customer measurements, Processing time, Shipping class [Standard / Fragile / Oversized],

Weight and dimensions, Care instructions, Return classification [Standard / Final sale / Custom-made / Hygiene-sensitive]), Search preview (SEO title and description), Product Photos (Upload Photo | Paste URL; "JPG, PNG, WEBP, up to 15 MB; about 1600px"; "AI uses only the first photo to suggest listing details"), Save Draft / Submit for Review / Cancel.
It is better than I first assumed: Save Draft, SEO fields, weight/dimensions, return classification, variants and AI help already exist. Problems: (a) photos are "optional but recommended" but approval hard-fails without one (BUG-01, 409 `missing_image`): require a photo on Submit (not on Save Draft) and say why; (b) weight and dimensions are optional yet Shipping Quotes shows "0.00 kg recorded" (BUG-29): require weight for anything shipped internationally; (c) the shipping fields sit mid-form below the fold; (d) a 54-country select with no search; (e) "Who is this for" duplicates the Women/Men/Kids nav and "Category" mirrors the craft list: define one taxonomy (Department > Craft > Occasion); (f) the AI line is a data-processing disclosure that needs a privacy link and an opt-out (what leaves the site, which provider, retention: NOT TESTED, AI not invoked); (g) no character counters (name, short description, SEO title); (h) price is a plain input: add separators, a minimum and a warning for N1-level prices (test products show how a N1 item can reach production; Paystack also has a minimum charge); (i) one long scroll with no section navigation. Photo "Paste URL": keep Upload as default; if kept, see S5/section 2.6 (server-side fetch, re-host) and warn that links can break. Effort M, impact High.

Edit Product. Opened by inference only (same form, per earlier BUG-01 evidence). Recommend "Changes to price or photos need re-approval" before saving a live product and a diff view for the admin.

"Add in bulk" (`d-vendor-bulk.png`). Wizard "Batch product listings" with modes CSV list (CSV only, up to 256 KB and 30 rows, sample CSV, category IDs table, photos matched by filename in `photoFile`) and Photo drafts; footer "Save drafts" / "Submit for review"; "Nothing is submitted until you choose." Strengths: draft-first, caps, review step. Gaps: category IDs rather than names (error-prone for artisans); Excel or a Google Sheet template would suit this audience better than CSV; prices typed as plain numbers; row-level validation preview NOT TESTED (nothing uploaded). Security, INFERRED: enforce row and size caps server-side (not only in the wizard), neutralise CSV formula injection (cells starting with =, +, -, @) wherever the data is later exported (including admin "Export All Orders (CSV)"), sanitise photo filenames. Effort M, impact Med.

Vendor application as a customer (`d-cust-vendor.png`). "Become a Vendor: Join our community of African artisans and designers": Contact Name, Business Name, Phone, "Business registration / CAC number (required before approval)", Business Description, "Register as Vendor". Short (good for conversion) but: no category or what you sell, location, links or photos, no bank details or documents, no explanation of verification time, commission or payout, and "Register as Vendor" implies instant registration. The CAC is "required before approval" yet BUG-27 shows approval without it. Recommend: a "How it works" panel (4 steps, timeline, commission, payout schedule); validate the CAC format (RC + digits) or offer a sole-trader route with ID; collect category and sample links/photos; rename to "Submit application"; redirect to a status page after submit; required acceptance of the Vendor Agreement with the version logged; Turnstile and rate limiting (INFERRED: any logged-in account can submit, so junk applications would flood the admin queue). Effort M, impact High.

S3. Public and member content, live

/events (`d-events.png`, `m-events.png`). Hero "Events, planned your way" with chips (Wedding, Naming Ceremony, Festival, Chieftaincy, Engagement, Party); "Plan the whole occasion" (find an approved planner, request a written quote; "Event fees are not collected through this page"; the

planner, not Afrolandx, confirms suppliers); empty state "No planners are approved yet. You can still explore the outfit collections below."; "My event plans"; "Plan events professionally" form (business name, service area, experience, Apply as event planner); "Find Your Collection" (event type, location, budget per person NGN, event size) and 10 event cards. Observations: three jobs in one long scroll (about 2,300px desktop, 3,150px mobile); the planner recruitment form sits between the customer section and the outfit finder; the customer quote path is a dead end with no waitlist; important legal clarifications are in small text; repeated generic icons on unrelated event cards. Recommend: lead with "Shop outfits for your event" (the only live path), put "Find a planner" behind "coming soon" with email capture until the first planner is approved, move "Become a planner" to the footer or profile menu; connect the finder to /products with event filters; numeric `inputmode` on Budget. Effort M, impact Med.

/collab-drops (`d-collab-drops.png`, `m-collab-drops.png`). "Designer Collaboration Hub", an "AI Suggest" button (seen with the admin session; not clicked; its function, provider, cost and audience are NOT TESTED) and an empty state ("No Collaboration Drops Yet"). Two nav labels for one thing ("Collabs" and "Collab Drops"). Recommend a "Notify me" capture and a teaser for the first drop instead of an empty page; hide AI tools from customers or label what they do; drop template with date, countdown, limited quantity, designer story; no urgency copy unless real. Effort S-M, impact Med.

/discover (`d-discover.png`, `m-discover.png`). Banner: "Internal preview only. Discover is hidden from customers, and new bookings and payments are disabled." Content: "Explore the continent", country selector (Nigeria, 8 cities), city quick links, category filters (Hotels, Malls, Restaurants, Attractions, Airports, Car Rentals, Cafes, Nightlife), "AfrolandX Exclusive Deals / Save up to 40%" (6 deal cards with Book), "List a Deal / Reach 50K+ travellers", commission note ("Partners keep 85-95%"), "Explore Countries" (54, region tabs), "Sponsored Destination / Promoted by Nigeria Tourism". It is a different product with placeholder, unverifiable claims, 4,444px desktop and **8,015px mobile**, and the main nav still links to it (BUG-22, BUG-36). Recommend: decide scope; remove invented deals, "50K+" and "Nigeria Tourism" claims until real (advertising and consumer-protection risk, sponsored content needs a real sponsor); disable Book buttons while payments are off; if kept, paginate and lazy-load, and reuse "By Country" shopping. Effort S to hide, L to build, impact Med.

/lookbook, AI Lookbook Studio (`d-lookbook.png`, `m-lookbook.png`, logged in). Large prompt box with an example, Event type (optional), Group size ("optional, one outfit is suggested", self-contradictory), Event location (Nigeria), Budget NGN (optional), "Prices stay in Nigerian naira regardless of event location", "Generate My Lookbook", and a "Your Lookbooks" history (empty). Not submitted (output quality, latency, moderation, limits NOT TESTED). Gaps: no usage limits, AI disclosure or data-use notice; no example output; with 0-1 live products the "pick pieces from our collection" promise cannot be met (empty or invented results). Logged-out view has no header (BUG-24). Recommend: 2-3 example lookbooks before sign-in; a disclosure ("AI suggestions; your text is sent to [provider]"); visible daily quota; recommend only approved in-stock products with a graceful "not enough products yet" state until about 30+ items; sanitise and cap prompt length, rate limit per user and IP (INFERRED: prompt abuse and cost); share to WhatsApp; "Shop this look" add-all-to-cart. Effort M, impact Med.

/reviews (`d-reviews.png`). Strong editorial page ("The Afrolandx Record: Made by hand. Known by experience."), 5-to-1 star histogram, sort (Most recent / Oldest first / Highest rated), "Verified means the reviewer completed a purchase on Afrolandx", and an honest empty state ("A quiet page, for now"). Gaps: all zeros plus "Community rating: -" reads like an error; no CTA ("Bought something? Review it

from My Orders") and /my-orders has no review entry point; page title and meta (BUG-08). Recommend: explain how reviews work and link to the shop while empty; add review prompts to delivered orders (D6). Effort S, impact Low-Med.

Chat widget (`d-chat.png`). Right-side panel titled "Afrolandx Assistant": "I can assist you with product recommendations, measurement guidance, orders, or any questions about African fashion!", input and send (not used). It does not say it is AI, offers no human hand-off or contact route inside the panel, no privacy note ("do not share card numbers"), no transcript copy, and it covers the right 30% of the page including hero CTAs; it also appears on checkout, vendor and admin pages. Recommend: label "AI assistant" with what it can and cannot see; "Talk to a person" (email, WhatsApp) and an out-of-hours message; attach the order number when opened from /my-orders; strip card-like numbers client-side; rate limit and Turnstile after N messages (INFERRED); hide on admin and checkout; accessible name (BUG-05). INFERRED security: treat chat text as untrusted in any admin viewer (stored XSS). Effort S-M, impact Med.

Login, email-code option (`d-login.png`). /login offers two buttons, "Continue with email and password" and "Continue with an email code", plus "New to Afrolandx? Create an account". I did not expand the code path (no code was requested): expiry, attempt limits, resend throttling and message uniformity are NOT TESTED. UX: remember the last method per device; show the destination masked, a resend timer and "wrong email?"; `autocomplete="one-time-code"`; "Forgot password" was not seen and change-password is still "Coming Soon". Security (INFERRED): per-account and per-IP throttling, single-use short-lived codes, identical responses for unknown emails, Turnstile after failures, email alert on new-device and any admin sign-in. Effort S-M, impact High.

Policies as a trust and legal surface (`d-policy.png`). A real strength. /policies is a "Trust Centre" with "Effective date: September 4, 2026 / Last updated: September 4, 2026", audience groups (customer, vendor, legal), 12 policies, and a note on where refunds are handled until a standalone Refund Policy is approved. The Return Policy has an "On this page" table of contents (11 sections), plain headings, "Who does what", a classification explanation that mirrors the Add Product return classification, and a contact email. The footer shows the company registration number and support email, and lists delivery partners. Gaps: the return policy says "as soon as possible" with no window in days and no clear statement of who pays return shipping; no consent banner or preference centre was seen (section 2.6 S8); policies promise features the product lacks (BUG-33; eight listed carriers while checkout cannot compute fees); no version history; no physical address, phone or hours in the footer; long slugs. Recommend: a 5-line summary box atop each policy (window in days, cost, timeline); link the product-page return box to the exact section; publish the standalone Refund Policy; policy version history and vendor re-acceptance on change; CAC number, address and hours in every footer; Privacy linked from every form collecting personal data. Only the hub and the Return Policy were read; no legal judgement is made. Effort S, impact Med-High.

S4. Mobile review (375px / Pixel 7), consolidated

Page	Evidence	Observation	Fix
Home	`m-home.png`	9-slide autoplaying hero fills the whole first screen; header has logo and hamburger only, no search; page about 14,400px.	Shorter hero, search under the header, product row above the fold, lazy-load slides 2-9, respect reduced motion.

Page	Evidence	Observation	Fix
Checkout	`m-checkout.png`, `m-cart-drawer.png`	BUG-31, BUG-32, BUG-34; each carrier card repeats the same blue sentence; chat bubble overlaps the "Save this address" row.	Sticky "Total
Cart drawer	`m-cart-drawer.png`	Clear structure (line item with +/-, total, "Shipping costs will be calculated at checkout", Proceed to Checkout, shipping options with days). Gaps: BUG-37; the days shown (DHL 2 to 4) do not match the later per-order estimate; chat overlaps the partner list.	Image, size and variant; "Clear cart" as a small link with undo; "Estimated delivery to [city]".
Vendor dashboard	`m-vendor-my-products.png`	BUG-31 (388px); 5 notification cards before any number.	KPI strip first, notifications in a bell, product cards with one primary action.
Admin dashboard	`m-admin-top.png`, `m-admin-vendors.png`	BUG-31 on Vendors and Users; 11 wrapped tabs; 4 red cards first; seed button at thumb height.	Off-canvas sidebar, bell, card tables, move the seed action.
Events	`m-events.png`	Three jobs in a 3,150px column; no overflow.	Reorder or tab (S3).
Collab Drops	`m-collab-drops.png`	One screen; empty state plus an unexplained AI button; no overflow.	Waitlist; hide AI tool.
Lookbook	`m-lookbook.png`	Usable, no overflow.	Examples, quota.
Discover	`m-discover.png`	8,015px; no overflow.	Hide, paginate, remove placeholders.

Mobile priority is INFERRED from Nigerian e-commerce norms, not from this site's analytics (not available to me).

S5. Security and best-practice checks added in this pass

Item	Status	Finding
Public product API field exposure	**TESTED**	`/api/products` returns `vendorId`, `clientImportKey`, `sku`, `status`, `weight`, `dimensions`, timestamps, SEO fields and return policy to anonymous callers (BUG-39). Use an allow-list serializer.
CORS	**TESTED**	A request with `Origin: https://evil.example` to `/api/products` got no `Access-Control-Allow-Origin`: no permissive CORS seen. Re-test credentialed endpoints.
Admin API without a session	**TESTED**	`GET /api/admin/users` returned 401 for anonymous (earlier report: 403 for customers).
Admin SPA shell	**TESTED**	`GET /admin` returns 200 with the app shell to anyone, so the route and its JS are discoverable; ship the admin bundle separately (A1).
`X-Powered-By: Express`, HSTS without preload	**TESTED**	BUG-40.
CSP / nosniff / Referrer-Policy	**TESTED** (BUG-10)	Still absent on `/`, `/admin`, `/api`.
Rate-limit headers	**TESTED (absence only)**	No `RateLimit` or `Retry-After` headers on the few requests I made; whether limits exist is NOT TESTED (I did not hammer).

Item	Status	Finding
Login throttling, email-code limits, lockout, CSRF tokens, session timeout, MFA, password reset	**INFERRED / NOT TESTED**	Would need form submits. Treat the recommendations as "verify".
Confirmations on Delete unused / Delete test data / Suspend / Reject / Clear cart	**NOT TESTED**	Not clicked.
Quote integrity (price snapshot bound to cart and address)	**INFERRED**	Ask the developer to confirm server-side enforcement. (The 25000 shown in the rate field is only a placeholder; see the corrected BUG-28.)
CSV bulk upload (injection, server caps)	**INFERRED**	See S2.
AI endpoints (Lookbook, AI Suggest, photo AI, chat): prompt injection, cost abuse, PII to a provider	**INFERRED / NOT TESTED**	Not invoked. Need auth, quotas, input limits, output moderation, provider DPA, disclosure.
Vendor-only account seeing others' data (BUG-35)	**INFERRED**	Needs a vendor-only test account.
Stored XSS (vendor text, reviews, chat, notifications)	**INFERRED**	Nothing injected. Escape on output, add CSP, sanitise.
IDOR beyond orders (vendor and admin resources, measurements, notifications)	**NOT TESTED**	Only orders were checked earlier (BUG-19); extend the access matrix.

Further recommendations: hide chat and third-party scripts on /admin; audit-log PII exports and list views; log creator and require vendor acceptance for admin-created drafts; separate "verify vendor" from "approve vendor" in code, not only labels; the banner "All admin actions are logged and audited for compliance" should be backed by a visible audit log or removed, because an unverifiable compliance claim is itself a risk.

S6. Additions to the roadmap

- **Now:** BUG-27 (enforce verify-before-approve); BUG-28 (replace the realistic "25000" placeholder with a neutral hint; low priority); triage the 10 stale quote requests and contact those customers (BUG-29); remove "Initialise categories" from the header; hide chat and Discover from roles that do not need them; checkout phone field and autofill (BUG-34); mobile overflow on checkout, vendor and admin (BUG-31); analytics glitches (BUG-30); ensure Discover placeholder promos can never be public (BUG-36).
- **Next:** quote workspace with aging and rate card; approval thumbnails and checklist; vendor status model with two-person rule and evidence; user drawer with soft delete and danger zone; split /events into three paths; policy summaries with the return window in days; "System health" panel; waitlists for empty Events, Collabs, Reviews; AI disclosure and quotas; Return/Cancel/Review entry points in /my-orders to match policies (BUG-33).
- **Later:** rate-card-driven automatic quotes; Excel/Sheets import with row preview; planner verification flow; Discover as a separate product decision; feature scheduling; payouts tab.

S7. Open questions added

15. Is the approved vendor with CAC "Not provided" intentional (manual partner onboarding) or a gap in approval logic? Is verification meant to be a hard gate?
16. What happens to the 10 September quote requests (real customers waiting a month)? Who owns quote turnaround and what SLA?
17. Where does the N25,000 default quote come from, and is there a rate card the form should use?
18. Is Discover (deals, listings, premium subscriptions, sponsored destinations) in launch scope, and are the discount and "50K+ travellers" claims real?
19. What does AI Suggest on Collab Drops do, who may use it, and which AI provider and budget apply to Lookbook, photo AI, AI Suggest and chat?
20. Do you want the event-planner marketplace at launch given no approved planners, and what is the commission model?
21. What exactly does "Initialise categories" do, and can it overwrite existing categories?
22. What is the return window in days, and who pays return shipping?
23. Can I have a vendor-only and a second plain-customer test account to verify BUG-35 and cross-account isolation without touching real users?

S8. Updated honest caveats (replaces the earlier "not re-walked" list)

Now reviewed live and read-only: all 11 admin tabs (desktop and mobile), the vendor-review and create-product-for-vendor dialogs, the vendor dashboard and its 4 tabs, Add Product, the bulk wizard, the vendor application as a customer, /events, /collab-drops, /discover, /lookbook (logged in), /reviews, the chat panel (opened, no message sent), the login method screen, the policy hub and the Return Policy, mobile checkout (read via the cart drawer's Proceed to Checkout, nothing submitted) and the cart drawer.

Still **not** verified:

- Anything needing a submit or a side-effecting click: Reject dialogs, Suspend, Delete unused / Delete test data confirmations, Clear cart, Approve and bulk-approve behaviour, quote confirm/reject emails, Edit Product (inferred), AI Suggest / Lookbook / chat / photo-AI output, the email-code and password-reset paths, sign-out, MFA (none seen), registration beyond Turnstile.
- Email content and delivery (order, quote, verification, notification emails).
- Rate limits, lockouts, CSRF, session expiry, upload validation (type, size, SSRF through Paste URL), webhook signature and idempotency, Paystack live/test mode, backups and monitoring: all INFERRED.
- Vendor-only and customer-only views of features seen with a multi-role account (BUG-35).
- Real-device performance, Safari/Firefox, screen readers, site analytics.
- 11 of 12 policy pages and their legal accuracy; NDPA/FCCPC points are product-level advice and need counsel.

Addendum: Shipping partner platform (a Temu-style logistics model)

Audience: the owner and product/operations leads deciding how Afrolandx ships orders at scale. Written 2026-10-05. Evidence labels: **OBSERVED** (seen live on the site or in the admin), **INFERRED** (reasoned from behaviour), **PROPOSED** (recommendation, not tested).

1. How the Temu-style model actually works

Temu does not leave shipping to each seller. The platform controls the whole chain, and sellers only prepare the parcel:

1. **Platform-set shipping promise.** The buyer sees one delivery date and one shipping price (often free over a threshold) before paying. The platform, not the seller, owns that promise.
2. **First mile.** The seller hands the parcel to a pickup or drop-off point near them, or the platform's partner collects it.
3. **Consolidation hubs.** Parcels from many sellers are sorted and bundled at hubs, which is what makes shipping cheap per parcel.
4. **Line-haul and customs.** Bundles move on contracted freight (air, road, sea), with customs paperwork generated by the platform from product data (HS code, value, weight, origin).
5. **Last mile.** A local partner delivers the final leg. For the buyer, tracking is one timeline across all legs, not several carrier sites.
6. **Rate cards, not quotes.** Prices come from agreed rate cards (zone x weight band x service level), computed automatically in milliseconds. A human is never in the loop for a normal order.
7. **Partner scorecards.** Each carrier is measured on pickup time, delivery time, loss, damage and exceptions. Bad lanes get less volume. Late deliveries trigger automatic compensation to the buyer.
8. **Returns and claims** are handled by the platform with partners, and the seller is charged back only when at fault.

For Afrolandx the same shape applies, adapted to African fashion: heavy-ish textiles, made-to-measure garments, fragile beads and crafts, buyers in Nigeria and a diaspora in the UK/US/Canada.

2. What the site has today (OBSERVED)

Capability	Today	Evidence
Carrier choice at checkout	8 options: UPS, FedEx, DHL, CargoNaija, Terminal Africa, Haulam, African Import Export Solutions, Hezelinks. All "Rate on request" with a flat estimate (₦7,500-9,000).	docs/checkout.png
Price	Flat estimate per carrier, same for every Nigerian state; not computed from weight, size or distance. Final rate is confirmed by a person afterwards.	docs/ship-est.png
Quote workflow	Admin tab "Shipping Quotes": per request a cart snapshot, address, "Confirmed rate", delivery estimate, validity days, notes, Confirm or Reject. Buyers can pay only an unexpired quote tied to an unchanged cart and address. A lower final price is blocked until the buyer's deposit is paid.	docs/quote-confirmed.png, 409 message
Operations	10 quote requests pending for about a month, not sorted by age, no alerts that escalate (BUG-29). Request #11 shows 0.00 kg recorded, so weight data is missing.	BUG-29

Capability	Today	Evidence
Product shipping data	Vendor form has shipping class (Standard, Fragile, Oversized), weight (kg), dimensions, processing time. All optional.	docs/add-product.png
Tracking for the buyer	A 4-step bar (Order Placed, Processing, Shipped, Delivered) and "Live tracking refreshes every 30 seconds". No carrier name link, tracking number or event timeline was seen.	docs/order27.png
Partner accounts	None. Carriers are a hard-coded list in the checkout, with no partner login, onboarding or API connection that is visible.	INFERRED
Vendor fulfilment	Vendor dashboard has Orders and Measurements tabs. No pickup booking, label printing or handover confirmation was seen.	docs/vendor-now.png
Policies	Shipping, return and vendor-settlement policies exist as pages.	/policies

Bottom line: the site has a manual, per-order quote desk. It is not yet a logistics platform, and the missing data (weight, dimensions, HS codes, phone numbers) means it cannot become one without new foundations.

3. Target operating model (PROPOSED)

Three shipping lanes, each with its own partner types and promise:

Lane	Example	Partner types	Buyer promise
A. Domestic Nigeria	Lagos vendor to Abuja buyer	Local courier partners and marketplace logistics aggregators	Delivery date range, flat or weight-banded price, doorstep or pickup point
B. Export (Nigeria to UK/US/Canada/EU)	Aso oke to London	Freight forwarders and consolidators with air/sea options (the CargoNaija, Haulam, African Import Export and Hezelinks type), plus express carriers for urgent orders	Economy (consolidated, cheaper, slower) vs Express, with duties messaging
C. Intra-Africa	Accra buyer, Lagos vendor	Regional carriers	Estimated delivery plus customs notes

Who pays and who promises: the platform shows one total (items + shipping + any duties estimate) and is the single promisor to the buyer. Partners are subcontractors under SLAs. Vendors pay only for first-mile where applicable, per the settlement policy.

Hub-and-spoke where it pays off: a Lagos hub (later Abuja and Ibadan) receives parcels from vendors, checks weight and photos, consolidates, and hands bundles to export partners. Domestic orders can skip the hub when partner pickup is available.

4. Platform building blocks needed

4.1 Data foundations (do first; everything depends on these)

- Required per product: weight, dimensions (L x W x H), shipping class, origin country, HS code (for exports) and declared value. Compute dimensional weight automatically. Make these mandatory before a product can be approved (today they are optional and Request #11 shows 0.00 kg).
- Required at checkout: phone number (with +234 validation), full address with state/LGA, delivery instructions and a landmark. Add address autofill. Today there is no phone field (BUG-34).
- A **Shipment** entity separate from the Order, because one order can split into several shipments (different vendors, different warehouses).

4.2 Rate engine (replace the manual quote desk for the normal case)

- Rate cards per partner: origin zone x destination zone x weight band x service level, with fuel surcharge, remote-area surcharge, fragile/oversized handling and validity dates.
- Checkout calls the rate engine and shows 2-3 relevant options, filtered by what actually serves the destination (CargoNaija only for the UK/USA/Canada lanes).
- Keep the human "Shipping Quotes" desk only for exceptions: oversized, restricted items, or unserved addresses. Auto-expire and auto-refund when it is not answered within a stated time (24-48h).
- Choose one honest pricing model and name it plainly: either "you pay the estimate and we refund any difference, never more than the estimate plus X%", or "pay for items now, shipping is invoiced within 24h". Drop "deposit" and "testing estimate" wording.

4.3 Partner onboarding portal (the platform for shipping providers)

A separate partner portal on its own host (see the admin-separation recommendation), with its own login, MFA and no access to customer or vendor data beyond the shipments assigned to them.

Onboarding steps (a checklist with statuses, like the vendor CAC review):

1. Company profile: legal name, CAC/registration number, tax ID, contacts, office and hub addresses.
2. Compliance: licence (e.g. courier/NIPOST permit as applicable), insurance certificate and cover amounts, goods-in-transit policy, anti-fraud and data-protection (NDPA) agreement, prohibited and restricted items acknowledgement.
3. Coverage: lanes served (origin and destination zones), service levels, cut-off times, pickup areas, max weight and dimensions, restricted goods.
4. Commercials: rate card upload or form, surcharges, transit-time commitments, claim limits, payment terms and settlement bank details.
5. Integration: API credentials (rate, booking, label, tracking) or a webhook endpoint, or the manual mode (below). A sandbox test shipment must pass before go-live.
6. Review and sign-off by a **verified superadmin** (re-using the existing approval gate), then a trial period with a volume cap.

Two integration modes so small carriers can join:

- **API/webhook mode:** the partner sends tracking events to a signed webhook, or Afrolandx polls their tracking API.
- **Portal-only mode:** the partner uses the portal to accept shipments, print labels, scan or press status buttons (Picked up, At hub, In transit, Out for delivery, Delivered, Exception) and upload proof of delivery. Partner mobile web view is essential, because many riders work from a phone.

Consider **aggregator APIs** (Terminal Africa is already on the checkout list) as a fast path to several domestic carriers and rates behind one integration, before building direct integrations. Verify coverage, fees and reliability with each before committing.

4.4 Tracking and status model

- A normalised event set across all partners: Label created, Pickup scheduled, Picked up, At origin hub, Departed, Customs (export), Customs cleared, At destination hub, Out for delivery, Delivery attempted, Delivered, Exception (with a reason code), Returned.

- Each shipment keeps an event timeline with time, location, source (partner API, portal, or manual), and photo/proof of delivery.
- **Buyer view:** one timeline on /my-orders and a public tracking page (order number + email, no login), with carrier name and link, tracking number, estimated date, and plain-language status. Email/SMS/WhatsApp notifications at key events (WhatsApp matters for this market).
- **Vendor view:** pickup request button, label download, handover confirmation, shipment status per order.

4.5 Control tower for admins ("what's going on out there")

A live operations screen, not just a list:

- Map and counters: shipments by stage, by lane, by partner; in transit; at hubs; delayed.
- Exceptions inbox: delays past promise, failed delivery attempts, address problems, customs holds, lost or damaged claims, each with an owner, a timer and a one-click message to partner and buyer.
- Aging and SLA: every quote request, pickup and delivery shows an age chip (green under 24h, amber 24-72h, red beyond) with auto-escalation. The 10 month-old quote requests would have been red from day 2.
- Partner scorecards: on-time pickup and delivery %, first-attempt delivery %, damage/loss rate, exception resolution time, API uptime, buyer ratings, claims cost. Rank partners per lane; shift volume away from weak ones automatically or by rule.
- Money views: shipping collected vs partner cost per shipment (margin), refunds of shipping differences, partner invoices, reconciliation.

4.6 Money flows and settlement

- Buyer pays one total. The platform holds funds, records shipping cost per shipment from the partner rate card, and pays partners on agreed terms (weekly or monthly), net of claims and penalties.
- Vendor payouts released after delivery confirmation (or a safe window), with shipping and return charge-backs applied per the settlement policy.
- Idempotent, verified payment webhooks and one server-side total (BUG-14) are prerequisites.

4.7 Customs, restricted items and cross-border

- Generate commercial invoices and packing lists from product data. Show a duties and taxes estimate (DDP vs DDU choice) at checkout for export lanes, so buyers are not surprised on delivery.
- Enforce the existing "prohibited and restricted products" policy in the product form: flag items needing licences (e.g. some artefacts, textiles with restrictions, food and cosmetics), and block unsupported lanes.

4.8 Returns and claims

- Return label generation, pickup or drop-off, inspection, refund trigger, and who bears the cost (platform, vendor, buyer) shown up front. The return policy currently points to an order-page return option that does not exist (BUG-33).
- Claims workflow with evidence upload, partner response deadline and automatic buyer compensation for late or lost parcels beyond the promise.

5. Partner portal and control-tower wireframes (PROPOSED)

```
PARTNER PORTAL (partner.afrolandx.com, MFA, partner role only)
+-----------+-------------------------------------------------------------+
| AFROLANDX | Partner: SwiftHaul Ltd        [Today v]            (SH) v      |

Customer tracking (simplified):

```
Order AFX-2026-000123      Delivery: 9-11 Oct   [Share tracking]
(o)--(o)--(o)--( )--( )     Paid > Packed > Picked up > In transit > Delivered
Picked up by SwiftHaul, Lagos hub - 6 Oct 14:20       Carrier: SwiftHaul  Track: SH-88231
[Message support]  [Cancel (until packed)]  [Return (after delivery)]
```

6. Security, privacy and best practice for this layer (PROPOSED)

- Partner role is separate from admin and vendor: least privilege, MFA, own host, short sessions, per-partner data isolation (a partner sees only its shipments, and only the buyer data needed to deliver: name, phone, address).
- Signed and replay-protected webhooks (HMAC, timestamp, idempotency keys). Allow-list partner IPs where practical. Rotate API keys; show last-used and revoke.
- Audit log for every status change, rate card change and manual override, shown in the control tower.
- Rate-card and quote changes require four-eyes approval above a threshold. No default or pre-filled rates.
- PII minimisation and NDPA compliance: retention limits, data-processing agreements with each partner, masking of buyer phone numbers where possible (proxy numbers for riders).
- Partner KYC and insurance verification, with expiry reminders so the certificate does not lapse unnoticed.
- Use unguessable shipment references for public tracking pages, and rate-limit the lookup (BUG-19 shows existing order IDs are guessable and give different errors).

7. Phased roadmap

- **Phase 0 - fix the foundations (weeks 1-4):** mandatory weight, dimensions and shipping class; phone and address quality at checkout; one server-side total (BUG-14); unpaid-order expiry and cancel (BUG-16); clear the 10 stale quote requests and add aging flags (BUG-29); remove the "Testing mode" and "deposit" language.
- **Phase 1 - rate cards and first partners (months 1-3):** Shipment entity; rate engine with a rate table per lane; onboard 2-3 domestic partners and 1 export partner in portal-only mode; normalised statuses; buyer tracking timeline and notifications; admin Shipments tab with an exceptions list.
- **Phase 2 - partner portal and control tower (months 3-6):** self-service onboarding with the checklist and superadmin sign-off; API/webhook integrations or an aggregator; partner scorecards; label generation; pickup scheduling; Lagos hub receiving and consolidation flow; claims and returns.
- **Phase 3 - scale (months 6-12):** customs documents and duties estimates, regional lanes, auto-allocation of volume to the best partner, delivery-promise compensation, public tracking page and WhatsApp updates, marketplace-wide shipping rules (free shipping thresholds, shipping insurance), finance reconciliation and partner invoicing.

8. KPIs to track

Quote-to-confirmed time (target: instant for 90% of orders), unpaid-order rate, on-time delivery %, first-attempt delivery %, damage/loss rate, cost per parcel by lane, shipping margin, support tickets per 100 orders ("where is my order"), claim resolution time, partner API uptime, and buyer rating of delivery.

9. Questions for the owner

1. Which lanes launch first: domestic only, or also UK/US export? (This decides whether hubs and customs come in Phase 1 or Phase 3.)
2. Does Afrolandx want to promise delivery dates and handle claims itself (Temu model), or only brokers the carrier relationship (marketplace model)? The first needs more working capital and insurance.
3. Are the 8 carriers on the checkout already contracted, or are they placeholders? Do they have APIs and negotiated rate cards?
4. Who will run logistics operations day to day (the control tower needs an owner and working hours)?
5. Should shipping be free above a threshold or always charged? Who funds free shipping: platform, vendor or both?
6. Where will the first hub be, and will vendors drop off or be collected?
7. Which pricing model for the shipping difference (refund vs invoice later)?
8. Are there legal or licensing constraints for the goods you plan to export that the product form must enforce?

10. What I could not verify

I did not see any partner-facing screen, API integration, label printing, hub process or tracking-number field, so "none today" is inferred from the live admin, vendor and buyer screens and the checkout carrier list. Contracts, rate cards and carrier API availability are unknown to me and should be confirmed with whoever manages those relationships.

Addendum B: Shipping model recommendation based on what already works in the market

Audience: the owner, who does not yet know which shipping model to choose. Written 2026-10-05 from public sources (listed at the end with a confidence rating). This addendum tells you what to do first; the earlier addendum describes the full target state.

1. The short answer

Start as a marketplace that uses a shipping aggregator, not a Temu-style warehouse operation. Copy Temu's buyer promises and tracking, not its warehouses. Add pickup points and an export consolidator later, only when order volume justifies the cost.

Why: every successful model below either (a) owns expensive infrastructure built over years (Jumia, Temu, Amazon), or (b) sits on top of existing carriers through one integration (Shipbubble, Terminal Africa, Etsy). Afrolandx today is closest to (b), and it already lists Terminal Africa, an aggregator, at checkout.

2. Evidence: what is working out there

Who	What they do	What to copy	What not to copy yet
Temu	Two modes. *Fully managed*: sellers consign goods, Temu prices, stores and ships them from its own warehouses. *Semi-managed* (launched March 2024): sellers keep control of local inventory and last-mile, while Temu runs the storefront, customer service and returns, with warehouses connected by API. Buyer protections: a credit when delivery misses the promised date, automatic refund after about 35 days with no action, and a free first return. Amounts differ by country (the UK and US figures I found are about £4 or $5 standard, £9 or $13 express).	The delivery promise at checkout, the late-delivery credit, the auto-refund timers and one tracking timeline.	Fully managed mode. It needs warehouses, customs operations, subsidies and large volumes.
Jumia (Nigeria)	Marketplace with its own logistics: about 357 pickup stations and 67 third-party logistics partners, a 32,000-agent community network (JForce), delivery in about 2-4 days even to hard-to-reach places, and logistics now offered to third-party sellers. Pickup stations are reported as over 80% of rural delivery points.	Pickup points as an alternative to doorstep delivery, which is the Nigerian answer to bad addresses. Local agents for trust.	Owning the network. It took years and heavy investment, and Jumia is still not consistently profitable.
Shipbubble (Nigeria)	"Payment aggregator but for logistics." The merchant picks which couriers appear at checkout. The platform returns rates and estimated dates, prints labels and packing slips, and sends tracking from checkout to delivery. Reported network of 40+ logistics partners (DHL, UPS, GIG, Topship, FEZ and others); integrates with shop platforms such as WooCommerce and Bumpa.	The whole pattern: calculated rates and dates at checkout, labels, automatic tracking, multiple couriers behind one integration.	Nothing. This is the fastest path. Verify current coverage and fees, since the figures are from 2023 press.
Terminal Africa	Shipping API: rates, pickup and delivery arrangement across 13+ couriers, "live within minutes". Already on your checkout list.	Same as Shipbubble. Compare the two on coverage, price, tracking quality and support before choosing.	Using only one aggregator forever. Keep the option to add carriers directly.

Who	What they do	What to copy	What not to copy yet
Etsy	Sellers buy discounted shipping labels inside the platform. Package details feed calculated shipping. **Tracking is required for seller protection** on orders over $10, and the tracking number is sent to the buyer automatically.	Platform-bought labels and mandatory tracking. This gives automatic status updates and makes "item not received" disputes provable.	Nothing.
Amazon (Buy with Prime)	A delivery promise date shown on the product and checkout pages; the platform owns the promise.	Show an expected delivery date, not a vague "rate on request".	Amazon's fulfilment network.
Aramex (Shop and Ship, MyUS), Afrety	Re-shipping and consolidation services that target diaspora and cross-border buyers; Afrety grew out of Senegal-France ties. African air cargo is reported as the fastest-growing in the world (+15.6% year on year, November 2025), driven by diaspora trade and cross-border e-commerce.	For your export lane: a consolidator that gathers parcels from Nigerian vendors and sends one bundle to the UK/US, then local delivery.	Building your own forwarding operation. Partner with a forwarder.
Carrier scorecards (industry practice)	Core KPIs are on-time delivery, first-attempt delivery, return-to-origin, transit time, damage, pickup success, cost and complaints. Best practice is to measure delivery against the **promise the customer saw at checkout**, not the carrier's own SLA, and to compare carriers with each other, reviewed monthly or quarterly.	The scorecard set and the "measure against the checkout promise" rule.	Complex weighting at the start. Begin with 4-5 metrics.

3. What the evidence says about Nigeria specifically

- **Addresses are the main failure point.** Large parts of urban and peri-urban Nigeria lack standardised addresses, drivers rely on phone calls, and failed deliveries are high, with one source putting 15-20% of cash-on-delivery orders failing before delivery, and over 25% in some secondary cities. Treat that figure as indicative, not exact (see source confidence).
- **Cash on delivery** is still a large share of e-commerce in much of Sub-Saharan Africa, but it adds handling risk, reconciliation work and failures when the buyer is not home. You already take payment online through Paystack. **Keep it pay-first** and do not add cash on delivery at the start.
- **Cross-border duties:** sources agree that surprise duty and tax bills at the doorstep are a top conversion killer and cause 10-20% package refusal in high-tax markets. Prefer **DDP (duties paid up front)** with the estimate shown at checkout, instead of DDU (buyer pays on delivery), at least for UK/US/Canada.

4. Recommended operating model for Afrolandx (PROPOSED)

Stage 1: Marketplace plus aggregator (months 0-3).

1. Pick one aggregator as the main rail (compare Shipbubble and Terminal Africa; keep the other as backup). Make rates, delivery dates, labels and tracking come from its API instead of a person confirming quotes.
2. Vendors ship the parcel (drop-off or rider pickup booked through the platform). The label is created inside Afrolandx. **A tracking number is required** before an order can be marked shipped (the Etsy rule).

3. Checkout shows 2-3 options with a price and an expected date, filtered by destination. One total, no "deposit".
4. Capture what couriers need: phone number, state and area, landmark and delivery notes, and a map pin if possible. This is the biggest lever on failed deliveries.
5. Copy Temu's buyer protections in a simple form: a late-delivery credit, an automatic refund timer when there is no tracking progress, and clear return rules. Fund them from shipping margin.
6. Keep a small human desk only for exceptions (oversized, restricted, unserved), and expire unanswered quotes.

Stage 2: Pickup points and the export lane (months 3-9).

- Add pickup points or partner lockers in the main cities (the Jumia pattern) as a cheaper, more reliable option where addresses are weak.
- For the UK/US diaspora, partner with one freight forwarder or consolidator (the Aramex/Afrety pattern). Vendors send to a Lagos intake point; the forwarder consolidates, clears customs and hands off to local delivery. Show duties up front (DDP).
- Build the partner portal and scorecards when you have 3 or more partners and enough volume to compare them.

Stage 3: Own hub, only if volume proves it (month 9 onward).

- Consider a Lagos hub for quality checks and consolidation only when parcel volume and delay costs justify it. Until then, someone else's hub is cheaper.

5. How to decide with data (a 6-8 week pilot)

Run 2 aggregators and 1 forwarder side by side on a small set of real orders, and record for each: price per parcel, time to pickup, on-time rate against the promise you showed, first-attempt delivery, damage or loss, tracking update lag, support responsiveness and buyer rating. Choose by these numbers and keep the second as a fallback.

6. What changes to the existing recommendations

- The Shipping Quotes desk becomes an **exceptions tool**, not the normal path.
- The partner onboarding portal moves to **Stage 2**, because in Stage 1 the aggregator is the partner. You still need partner records, a scorecard and an admin view of shipments from day one.
- Mandatory product weight, dimensions and shipping class, and checkout phone and address quality, become the **first engineering tasks**, since every rate API needs them.
- The control tower can start small: shipments by status, delayed items, an exceptions inbox and age flags.

7. Questions this evidence leaves for you

1. Do you want to offer pickup points in Stage 2, or stay doorstep-only?
2. Are you willing to fund a late-delivery credit and a free first return, as Temu does? What monthly budget?
3. For export, is the priority speed (express) or price (consolidated air or sea)?
4. Who will own carrier relationships and the monthly scorecard review?

8. Sources and how far to trust them

Confidence: **High** = official or well-established publication or company page; **Medium** = reputable trade or news article; **Low** = blog or vendor marketing, figures may be dated or biased. I could only run searches, not read every page in full.

- Temu semi-managed mode: eTowerTech, Alibaba SmartBuy, Tech Buzz China. **Medium/Low**: industry blogs; the March 2024 launch is consistently reported.
- Temu late-delivery credits and refund timers: Parcel Monitor, Tom's Guide. **Medium**. Amounts are for the UK and US; I did not find Nigeria's terms.
- Jumia logistics: WeeTracker, Oct 2025, Jumia logistics services (company PDF), Stattimes. **Medium/High**. The station and partner counts are as reported there and may have changed.
- Shipbubble: TechCabal 2023, TechCabal on the Bumpa partnership. **Medium**, from 2023; verify the current partner count and fees directly.
- Terminal Africa: App Store listing, npm package. **Low/Medium**: the "13+ couriers" and "live in minutes" claims are the vendor's own.
- Etsy labels and seller protection: Etsy Help, ParcelPath. **Medium**; confirm current thresholds on Etsy's site.
- Amazon delivery promise: Buy with Prime documentation. **High**.
- Africa cross-border and diaspora trade: Leadership, DHL on cross-border logistics 2025, DHL on remittances and e-commerce. **Medium**; the 15.6% figure comes from a news report.
- Nigerian last-mile problems: DHL Nigeria on "where's my order", Techpoint, Nexdigm. **Medium**. The specific failure percentages came from lower-quality summaries; treat them as a direction, not a benchmark, and measure your own.
- Carrier scorecards: nShift, ClickPost. **Low/Medium**: vendor content, but the practices are widely used.
- DDP vs DDU: ShipBob, Ecommerce Fastlane. **Low/Medium**: the 10-20% refusal figure is a general claim for high-tax markets; Nigeria-specific data was not found.

Not verified: I did not read the carriers' or aggregators' pricing pages, coverage maps or API terms, and I did not check whether the carriers on your checkout (CargoNaija, Haulam, African Import Export Solutions, Hezelinks) have APIs. Those are the first things to confirm.

Addendum C: Review of the new shipping desk and the purchase flow (2026-10-06)

Audience: the owner and the developer. Evidence: two paid test orders (#28 and #29) taken through checkout, the admin and vendor shipping desks and the buyer, vendor and admin views (BUG-41 to BUG-50 in BUG_REPORT.md). Labels: **TESTED** (seen live), **PROPOSED** (recommendation).

1. What works (TESTED)

- A gated, auditable sequence on every shipment: vendor ready, partner assigned, cost quote, approval, buyer shipping settled, booking, agency payment record, then status updates. Each event shows who did it (system, vendor, admin) and when.

- A separate vendor view that limits vendors to "mark ready for pickup" and shows only their own shipments; anonymous visitors and ordinary customers cannot open the desk or the partner APIs.
- Customers see a live shipment timeline and a status chip that moves from "Awaiting Shipping Quote" to "Processing" to "Delivered".
- Immutability warnings on irreversible steps, and a "Delayed" state that can return to earlier states.

2. Recommendations (all PROPOSED)

#	Problem (evidence)	Recommendation	Effort / Impact
1	The ₦1 test shipping option and the "Testing mode" banner are shown to ordinary buyers (BUG-50, BUG-17).	Gate the option behind an admin or staging flag, and remove the banner from the live site. Keep QA on a separate staging site with its own Paystack test keys.	S / High
2	After a successful payment the return page says "Payment confirmation unavailable… before trying payment again" (BUG-41, seen twice).	Make the page wait for payment confirmation (poll the order for a few seconds), then show the real state. Never suggest paying again while an order may be paid. Send the confirmation email from the same event.	S / High
3	The buyer sees ₦3 before the shipping is settled and ₦2 after, while the charge is ₦2 (BUG-14, BUG-42).	Show one total everywhere, computed on the server: items + shipping estimate. Label any later difference as "adjustment" with the reason.	M / High
4	Vendor Orders tab says "No orders yet" even for paid and delivered orders (BUG-46).	List every paid order containing the vendor's products, with the shipment status and the "ready for pickup" action.	S / High
5	Customers and vendors see internal notes, the partner's name, and the booking reference, in notifications, timelines and the vendor API (BUG-47).	Keep two event streams: customer-facing milestones (Preparing, Picked up, In transit, Out for delivery, Delivered) and internal events (admin only). Return only needed fields in the vendor API.	M / High
6	"Delivered" needs only a free-text box and can be set seconds after "Collected" (BUG-48).	Require structured proof (photo or signature, recipient name, time), block impossible timelines, and use a second approver for high-value parcels. Add the delivery-confirmation queue and payout hold from the agent app spec (sections 19 and 5).	M / High
7	The Save button for "Collected" stays disabled with no explanation until the agency payment is recorded (BUG-45).	Show the unmet prerequisite next to every disabled control ("Record the agency payment first").	S / Med
8	Vendor "Ready for pickup" returns HTTP 500 for a +234 phone number (BUG-49).	Accept international formats, validate on the server, and return a 400 with a field message instead of a 500.	S / Med
9	Vendors receive the buyer's full address and name (TESTED).	In the agent model the vendor only needs the order and the intake point. Show the buyer's address to the agent and courier only.	S / Med
10	Unpaid orders cannot be cancelled or resumed; "Buy again" appears on them (BUG-16).	Add Pay and Cancel to unpaid orders, hide "Buy again", expire after 24 to 48 hours, and exclude them from admin alerts.	M / Med
11	Delivered orders offer no Return, Review, "I received it" or "Report a problem" (BUG-33).	Add these actions, tied to the payout hold.	M / Med
12	The desk's "needs attention" counter and the Shipping Quotes backlog have no aging rules (BUG-29).	Add age chips and SLA targets (see agent spec section 21), sort oldest first, and alert at the thresholds.	S-M / High

#	Problem (evidence)	Recommendation	Effort / Impact
13	Records created while testing (partners, quotes, immutable payments, delivered shipments) cannot be removed.	Add a controlled "void" with a reason and a second approver, and run QA on staging only.	M / Med
14	Two QA products are public, and image upload returns 503 so product creation with a real photo fails entirely (BUG-01).	Restore image storage with monitoring, then remove the "Paste URL" route or put it behind an allow-listed fetcher.	M / High
15	The header overflows at 1280px for vendor and admin roles (BUG-44) and admin tables overflow on phones (BUG-31).	Collapse the role links into the avatar menu and move admin navigation to a sidebar (see section 2.1).	M / Low-Med

3. Suggested order

1. Gate the test shipping and remove the banner (1), fix the payment return page (2), and restore image storage (14).
2. Fix the vendor Orders tab, the internal-event exposure, and the totals (4, 5, 3).
3. Add structured delivery proof, the confirmation queue and the payout hold (6), then returns and buyer actions (11).
4. Add explanations on disabled controls, phone validation, unpaid-order handling and aging rules (7, 8, 10, 12).

4. What is not covered

Emails, real payments (Paystack is in test mode), the agent app, courier proof links, returns, payouts and anything that needs a staging site were not tested. Full detail is in BUG_REPORT.md.

Part C: Agent app requirements spec

Afrolandx Agent App: requirements spec (draft v1)

Audience: the developer building it, and the owner approving scope. Written 2026-10-05. Status: **PROPOSED**. Nothing here exists today. Items marked (confirm) need a business decision.

0. Decisions made by the owner (2026-10-05)

1. **All orders go through an agent.** Every paid order has one or more parcels that vendors send to an assigned intake point, so agents get an update (expected parcel) for every order.
2. **Agents are staffed and managed by the admin team.** Agent accounts are created by admins (verified superadmin), not by vendors or self-registration.
3. **Vendor payout happens after the customer receives the order**, and preferably after a return window as well (see section 5 and 18 for the proposed rule and what the published policy says today).
4. **Admins set up all intake points and agent accounts** in the admin area (confirmed; no per-point staffing numbers are needed in this spec).
5. **Payout hold confirmed:** 7 days after delivery for standard-returns items, 48 hours for final-sale and custom-made items, paused by any open claim or return.
6. **Delivery is confirmed by an admin after reviewing the courier's proof of delivery** (workflow in section 19).
7. **Returns travel the same route in reverse:** the courier that delivered abroad brings the item back to Nigeria, then to the agent (workflow in section 20).
8. **Service levels and capacity were left to the spec author** (proposed in section 21, to be calibrated in a pilot).
9. **Auto-confirm delivery (decided 2026-10-06):** if an admin has not acted 3 working days after complete proof of delivery arrives, and all automatic checks pass and the buyer has reported no problem, the system confirms delivery automatically (section 19).
10. **Buyer's "I received it" button (decided):** it shortens the payout hold for standard-returns items to 3 days. It never lengthens a hold, and final-sale and custom-made items keep their 48-hour hold.
11. **The platform pays return shipping for all classifications (decided).** Open follow-up in section 20 on whether the platform may recover it from the vendor when the vendor is at fault.
12. **Customs rules for goods returning to Nigeria:** the owner will ask the courier the week of 2026-10-06; the question list is in docs/COURIER_VETTING_CHECKLIST.md (section E).
13. **A courier vetting checklist** that includes reverse shipping was requested and created: docs/COURIER_VETTING_CHECKLIST.md.

1. Purpose

Agents work at an intake point (drop-off hub). They receive parcels from vendors, verify them against the order, record the handoff to a courier, and flag problems. The app gives Afrolandx a recorded chain of custody (vendor to agent to courier to buyer), a quality check before goods ship, and a reliable trigger for customer tracking and vendor payout.

Shipping companies are **not** users of this app at launch. They are booked manually (see section 9).

2. Placement and architecture

- Separate site on its own host, e.g. `agents.afrolandx.com`. Same backend and database as the main site, separate front end, separate login screen.
- No link to it anywhere on the customer, vendor or admin sites.
- Own session cookie, **host-only** (no `Domain=.afrolandx.com`), Secure, HttpOnly, SameSite=Lax or Strict, short idle timeout (e.g. 30 min) and an absolute limit (e.g. 12 h).
- Own API namespace `/api/agent/*`. Every request checks: valid agent session, agent role, and that the order or parcel belongs to the agent's intake point.
- Installable web app (PWA), mobile first, camera upload, offline queue for updates.

3. Roles and permissions

Action	Agent	Intake manager (optional)	Admin	Vendor	Customer
Sign in to the agent app	Yes	Yes	Yes (support view)	No	No
See parcels at own intake point	Yes	Yes (all agents at the point)	All	Own parcels' status only	Own order status only
Confirm receipt, run checklist, log handoff	Yes	Yes	Override with reason	No	No
Create or deactivate agents, assign intake points	No	No	Yes (verified superadmin to create agents)	No	No
See buyer phone and address	Only for parcels at own point	Same	Yes	Own orders	Own
Export data	No	Summary only	Yes	No	No

4. Core data (new entities)

- **IntakePoint**: id, name, address, city and state, opening hours, contact, active flag, capacity notes.
- **Agent** (a user with role `agent`): user id, intake point(s), status (invited, active, suspended), MFA enrolled, last active.
- **Parcel** (one physical package; an order can have several): id, order id, vendor id, intake point, expected-by date, declared weight, declared dimensions, shipping class, status (see section 5), tracking reference, label/manifest id.
- **VerificationCheck**: parcel id, agent id, timestamp, outcome (pass, pass with notes, fail), checklist answers (section 6), photos, measured weight and dimensions, notes.
- **Handoff**: parcel id, from (vendor, agent, courier), to, timestamp, person name, signature or photo, location, batch id.
- **Batch/Manifest**: id, courier, intake point, parcels, created by, created at, pickup time, status.
- **Issue**: parcel id, type (damaged, wrong item, missing, restricted, address problem, late vendor, other), severity, description, photos, owner, status, timestamps.
- **AuditLog**: actor, role, action, entity, before and after, IP, device, time. Append-only.

5. Parcel status flow

`Awaiting vendor drop-off` > `Received at intake` > `Checked: passed` or `Checked: failed (issue open)` > `Packed and labelled` > `In batch` > `Handed to courier` > (`In transit` > `Delivered` come from tracking, see section 9).

Rules: a parcel cannot move to `Handed to courier` without a passed check, a weight, a label or tracking reference and a handoff record. A failed check opens an Issue and notifies the vendor and admin.

Triggers (updated with the owner's decisions):

- `Received at intake`: records the exact timestamp that **closes the customer's cancellation window** (see section 18). From this moment the order can no longer be cancelled by the customer under the published policy.
- `Handed to courier` ("verified and dispatched"): starts customer tracking, notifies the buyer. It does **not** release vendor money.
- `Delivered` (courier proof of delivery, or buyer confirmation, or auto-confirmed after a set number of days with no dispute): starts the vendor payout hold.
- **Payout release (proposed rule, confirm with finance):** release the vendor's net amount after `Delivered` plus a hold of N days, where N depends on the product's return classification: standard-returns items hold for the return window (proposed 7 days), final-sale and custom-made items hold a shorter period (proposed 48 hours) for damage or wrong-item claims only. Any open return, claim or dispute pauses the hold. Deductions (commission, payment fees, logistics, verification, refunds) are applied at release and itemised on the vendor's statement.

6. Verification checklist (default; admin-editable per category)

1. Order and parcel number match; vendor identity confirmed.
2. Item matches the listing: photo, colour, size, material, quantity (compare with product page images).
3. Condition: no damage, stains or defects; packaging suitable for the shipping class (fragile, oversized).
4. Made-to-measure items: measurements attached and match the order.
5. Restricted or prohibited items check (per the platform's prohibited products policy).
6. Weigh and measure: record actual weight and dimensions; flag if more than a set tolerance (e.g. 10%) off the declared values.
7. Photos: at least one of the item and one of the sealed, labelled parcel.
8. Outcome: pass, pass with notes, or fail with reason.

Checks must be recorded before the parcel can be sealed. Vendors can see the outcome and photos, and can dispute a fail through a form (admin resolves).

7. Screens (agent app)

1. **Sign in**: email and password plus MFA code; bot check; no registration; "forgot password" through admin-issued reset only. Lockout after repeated failures.
2. **Today** (home): counters (Expected, Received, To check, Ready for courier, Issues), search by order or parcel number, scan QR or barcode.

3. **Incoming**: list of parcels expected at this point, with vendor, order number, expected date, overdue flag. Action: Confirm received.
4. **Parcel detail**: order summary (item list, photos, measurements, shipping class), vendor, destination city and country (full address only after check passed), status timeline, notes, Issue list.
5. **Check**: the checklist, camera capture, weight and dimension entry, outcome buttons. Works offline.
6. **Pack and label**: confirm packaging, attach or print the label, enter tracking reference if a courier label is used.
7. **Batch**: select parcels ready for the same courier, generate the manifest (PDF and CSV), set pickup time, record courier person and vehicle, capture signature or photo, mark Handed to courier.
8. **Issues**: create, view, add photos and notes, escalate to admin.
9. **History**: parcels completed by this agent, filters by date and status.
10. **Profile**: name, intake point, language, sign out of all devices.

8. Admin additions (in the existing admin, grouped under Operations)

- **Intake points**: create, edit, activate or deactivate.
- **Agents**: invite by email, assign points, suspend, see last activity, reset MFA.
- **Parcels and handoffs**: search, filters (status, point, vendor, age), exceptions inbox, age chips (green under 24 h, amber 24-72 h, red beyond), full audit trail per parcel.
- **Checklists**: edit templates per category.
- **Reports**: parcels per point, check fail rate by vendor, time from receipt to handoff, issues by type, weight discrepancy rate.
- **Disputes**: vendor disputes of failed checks, with evidence side by side.

9. Shipping companies (manual at launch)

- Onboarded and vetted offline: documents (registration, licence, insurance), coverage, rate card, claims terms, escalation contact, 3-5 test parcels, capped pilot. Keep a simple **Partner** record in the admin (name, contacts, lanes, rate card file, status, notes).
- Booking by email, WhatsApp or the courier's own site, using the manifest from section 7.
- Status updates without giving them accounts: each batch gets a **private, expiring status link** where the courier presses buttons (Picked up, In transit, Out for delivery, Delivered, Exception) and uploads proof of delivery. Alternative: upload a CSV of statuses. Every update is stored as an event with its source.
- Later (Phase 2): proper partner accounts or an aggregator API (e.g. Terminal Africa or Shipbubble, to be evaluated) replace the manual steps.

10. Notifications

- Agent: new parcels expected, overdue parcels, issue updates (push or SMS or WhatsApp; confirm channel and cost).
- Vendor: received at intake, check result, dispatched, issue opened.
- Buyer: dispatched with tracking reference; delay notices.
- Admin: issue opened, failed check, parcel overdue at intake, courier exception.

11. Security and privacy requirements

- Role-based access with server-side enforcement on every endpoint; consistent 403 or 404 for resources outside the agent's point (no 500s that reveal existence, see BUG-19).
- MFA for all agents; invite-only; device and session list; remote sign-out.
- Least data: show only what the step needs; mask buyer phone numbers where possible (call or WhatsApp proxy); no data export for agents.
- Photo uploads: allow only image types, size limits, virus scan, re-host in Afrolandx storage. Do not accept external image URLs (the current "Paste URL" approach is an abuse risk).
- Audit log for every state change, override, view of buyer contact data, and failed login. Admin-visible, tamper-evident.
- Rate limiting, lockout, bot protection on login. Security headers (CSP, X-Content-Type-Options, Referrer-Policy, HSTS).
- NDPA compliance: data-processing terms with agents and couriers, retention limits for photos and addresses, a process for deletion requests.
- Separate staging environment with test agents; production credentials never shared.

12. Non-functional requirements

- Works on low-end Android phones and on slow 3G; first screen loads in under 3 s on a mid-range phone.
- Offline: checklist, photos and status changes queue locally and sync with conflict handling and timestamps.
- Accessibility: large tap targets, high contrast (the main site's gold-on-beige text has contrast problems), clear labels on every button.
- English first; leave room for Yoruba, Hausa, Igbo and Pidgin labels.
- Availability target and backup plan for the handoff records (they are evidence in disputes).

13. Dependencies and blockers

1. **Image storage must work** (BUG-01, 503 today). Check photos depend on it.
2. **Product weight, dimensions and shipping class must be mandatory** before approval (Request #11 shows 0.00 kg).
3. **One consistent order total and payment state** (BUG-14, BUG-16): parcels should only exist for paid orders.
4. Admin role model with a verified superadmin to create agents (the approval gate already exists).
5. Separate host, TLS and DNS, and host-only cookies.

14. Acceptance criteria (high level)

- An agent can sign in with MFA on their phone, see only parcels for their point, confirm receipt, complete a check with photos offline, and hand a batch to a courier with a signature, and all of it appears in the admin audit trail.
- A customer, vendor or admin session cannot call `/api/agent/*` except where the matrix in section 3 allows it, and an agent session cannot call any other role's APIs.
- A parcel cannot reach `Handed to courier` without a passed check, weight and handoff record.

- A failed check notifies the vendor and admin, and the vendor can dispute it.
- "Verified and dispatched" changes the buyer's tracking and the vendor payout state exactly once (idempotent).
- Penetration-style tests: access from other roles, other intake points, expired sessions, replayed requests, oversized and non-image uploads, and guessing parcel IDs all fail safely.

15. Out of scope for v1

Courier accounts and portal, automatic carrier rate shopping and label purchase, cash handling, customer pickup at intake points, route planning, hub sorting automation, and returns processing (plan these in Phase 2 using the same Parcel and Handoff model).

16. Open questions for the owner

Answered on 2026-10-05: all orders go through agents; agents are staffed by the admin team; payout is after delivery (and preferably after a return window).

Still open:

1. *(Decided: payout hold of 7 days / 48 hours, see section 0. Still to do: write it into the policy and vendor dashboard, section 18.)*
2. *(Decided: admin confirms delivery after courier proof; auto-confirm after 3 working days when proof is complete and checks pass; the buyer's "I received it" shortens the standard hold to 3 days. Section 19.)*
3. *(Decided: admins set up intake points and agents; staffing numbers are out of scope here.)*
4. Which notification channel for agents (WhatsApp, SMS, push) and who pays for it?
5. What is the tolerance for weight and dimension differences, and who pays the extra shipping cost when a vendor under-declares?
6. Should the buyer see the agent's check photos?
7. Do agents need a supervisor or intake-manager role?
8. *(Decided: returns come back through the same courier and the same intake point; the platform pays return fees, section 20. Still open: customs treatment for goods re-imported to Nigeria (owner is asking the courier), and whether Afrolandx recovers return costs from a vendor who is at fault.)*
9. *(Proposed in section 21; calibrate with real parcel counts during a pilot.)*

18. Alignment with the published policies (read on 2026-10-05)

What the live policy pages already say, and what the agent app must do about it:

Policy statement (summarised)	Source page	Implication for the agent app
Vendors must send the item "to the assigned verification agent" and keep proof of dispatch. Verification may check identity, quantity, condition, packaging and listing consistency, but does not remove vendor responsibility.	Vendor orders, shipping, returns and settlement	The vendor dashboard must show the **assigned intake point, address, drop-off hours and deadline** per order. Checklist items (section 6) already match these five checks.

Policy statement (summarised)	Source page	Implication for the agent app
A customer may request cancellation until the **earlier of 42 hours after ordering or the item being received by the verification agent or logistics provider**.	Shipping policy; vendor policy	The `Received at intake` timestamp is legally meaningful. It must be recorded exactly, cannot be edited by an agent (admin override with reason only), and must be shown to the customer. The 42-hour deadline also needs a visible countdown and a working **Cancel** button for customers (BUG-16: none exists today).
"Where verification applies, the item is checked before handover to the logistics provider."	Shipping policy	The owner decided verification applies to **all** orders. Update this sentence to say so.
Settlement timing: "The dashboard or signed schedule states ... any settlement timing and conditions; this policy does not promise a cadence or hold period."	Vendor policy, section 9	**The payout rule is not defined anywhere yet.** The owner's decision (after delivery, ideally after the return window) needs to be written into the policy or the vendor schedule and into the dashboard, then enforced by the payout logic.
Vendors must respond to a claim within 2 business days; request review within 14 calendar days.	Vendor policy	A failed check or customer claim opens an Issue with a 2-business-day vendor response timer and a 14-day review window.
Return policy: customers lodge an approved return within 7 calendar days after approval; do not hand the item to a rider, vendor or agent without approval; Afrolandx "may involve carriers or verification agents". Items classified final sale or custom-made are excluded from change-of-mind returns.	Return policy	Supports the proposed hold lengths. Plan how returned items reach an agent for inspection (open question 8). The return policy says to open the order and select "Request a return", which does not exist yet (BUG-33).

Edit the shipping policy sentence ("where verification applies") and the settlement section when the payout rule is final, so the published terms match what the platform actually does.

19. Delivery confirmation by admin (how it works)

Goal: the vendor is paid only after delivery is confirmed by a person who has seen real proof, and the hold clock starts from a recorded, auditable moment.

Step 1: proof arrives. The courier supplies proof of delivery (POD) through the batch's private status link, a CSV upload, or an admin upload of what the courier emailed. POD fields: recipient name, delivery date and time, photo of the parcel at the door or a signature, GPS point if available, the courier's tracking reference, and the courier agent's name.

Step 2: the parcel appears in the admin "Delivery confirmations" queue. Each row shows the order, parcel and tracking reference, destination address, POD photo or signature, delivery time, courier events timeline, and automatic checks:

- POD present with a recipient name and a photo or signature.
- Delivery time is after the dispatch time and inside a plausible window.
- Delivery location is near the buyer's address (when GPS exists).
- Tracking reference and parcel match.
- No open dispute, claim or "item not received" report from the buyer.
- Value above a threshold (for example, N100,000) is marked "needs second approver".

Step 3: admin decides. Buttons: **Confirm delivered**, **Request more proof** (message to courier, parcel stays pending), **Mark exception** (wrong address, refused, damaged; opens an Issue). Confirm requires all automatic checks green or an override reason typed by the admin. High-value parcels need a second admin (four-eyes).

Step 4: effects of Confirm (all idempotent, recorded in the audit log with admin name and time):

1. Parcel and order status become `Delivered`, using the **POD time** as the delivery time.
2. The buyer is notified ("Your order was delivered") with a **Report a problem** button valid for the hold period.
3. The vendor payout hold starts: 7 days for standard-returns items, 48 hours for final-sale and custom-made items. An open claim, return or dispute pauses it.
4. At the end of the hold, payout is released automatically, net of itemised deductions, unless paused. Release and failures are visible to finance in the admin.

Service and safeguards.

- Target: confirm within 1 working day of POD arriving. Rows older than that turn amber, then red, and appear in the exceptions inbox. Show queue age counters on the admin dashboard.
- **Auto-confirm (decided).** If a row has complete proof, every automatic check is green, the buyer has made no report, and no admin has acted within **3 working days** of the proof arriving, the system confirms delivery itself. The audit log records "auto-confirmed", the proof time and which checks passed. Rows with any red check, any buyer report, or value above the second-approver threshold never auto-confirm; they stay in the queue and escalate. Send the owner and admin group an alert at day 2 so a person can still act first, and show the count of auto-confirmed parcels in the weekly report so the backlog is visible.
- **Buyer's "I received it" button (decided).** It is an extra signal, not a replacement for proof. For standard-returns items it shortens the payout hold to **3 days** from the click (never longer than the original hold). It only works once the parcel is `Delivered` (admin- or auto-confirmed), and is disabled if a claim or return is open. Final-sale and custom-made items keep their 48-hour hold.
- Bulk actions: select many rows with all checks green and confirm them together, with the audit log recording each parcel.
- Fraud controls: POD edits are not allowed (only replace with a new upload, the old one kept); the admin who uploaded or approved a POD cannot also approve its payout release without a second person for high-value parcels.

20. Returns route (reverse logistics)

Owner decision: a returned item goes back by the same courier that delivered it abroad, back to Nigeria, and then to the agent.

1. **Request and approval.** The customer requests a return from the order page (this page does not exist yet, BUG-33). An admin approves or declines under the return policy and the item's classification. The customer receives a return ID, instructions and the **return label or booking reference** created by Afrolandx. Customers must not hand the item to a rider, vendor or agent without approval (as the policy states).
2. **Lodging.** The policy gives 7 calendar days after approval to lodge the parcel with the nominated tracked service. The return shipment is a normal Parcel linked to the original, direction `return`, with its own tracking events.

3. **Transit.** The same courier carries it destination country > Nigeria. Admin sees it in the control tower with the same age and exception rules. The courier delivers it to the intake point (the original point by default, or the one the admin chooses).
4. **Agent receives and inspects.** The agent scans the return, records the timestamp, and completes a **return checklist**: package condition, item matches the original order and the vendor-check photos taken at intake, completeness (accessories, tags), signs of wear or damage, authenticity, and photos. Outcome: `Accept`, `Accept with deduction`, or `Reject` with reasons.
5. **Admin decides the refund** using the outcome and the evidence: full or partial refund, replacement, or rejection. Refund goes back through the payment provider. The vendor payout is reduced or reversed according to who is at fault (vendor, buyer or courier).
6. **Item disposition.** Return to the vendor, restock (if the vendor holds stock at the point), or dispose. Each step is a Handoff record.
7. **Hold and payout.** A return request pauses the vendor payout hold. If the return is rejected, the hold resumes. If accepted, the payout is adjusted at release.

Dependencies and risks to settle before launch:

- The courier contract must include **reverse logistics** (price, transit time, liability and loss handling). Add this to the manual courier vetting checklist.
- **Who pays return shipping (decided): the platform handles return fees for every classification.** The customer is not charged for the return label. Consequences to plan for: (a) budget a return-shipping cost line per lane and track it as a KPI (return rate times average round-trip cost, since international returns can cost more than the item); (b) the vendor policy says vendors are generally responsible for defective or misdescribed goods and may bear "reasonable delivery costs", so decide whether Afrolandx recovers the cost from the vendor when the vendor is at fault, and update the policy to match; (c) abuse controls are still needed (return limits per account, inspection before refund, no label for items classified final sale or custom-made unless faulty), because free returns invite misuse.
- **Customs on goods returned to Nigeria:** the returned goods may need export and import paperwork or a duty relief claim. This needs advice from a customs agent or the courier. It is not verified here.
- Time and cost: the round trip may take weeks, so the policy's timelines (7 days to lodge, 14 days to request review) must still make sense for international returns.
- Insurance for the return leg, and evidence from the delivery POD and the agent's original check photos to resolve "not the same item" disputes.

21. Service levels and capacity (proposed, to calibrate in a pilot)

Service levels (working hours: for example Monday to Saturday, 9:00 to 17:00; define holiday coverage):

Step	Target	Escalation
Vendor drop-off after order acceptance	Within the listing's handling time	Amber at handling time, red at +24 h; vendor and admin notified. The 42-hour customer cancellation window is the reference clock.
Agent logs `Received at intake`	Same working day as arrival, within 1 hour of the parcel being handed over	Parcel stuck without a scan for 4 working hours is flagged to the point's lead agent.

Step	Target	Escalation
Check completed	Within 4 working hours of receipt	Amber at 4 h, red at 8 h.
Handed to courier	Within 24 hours of a passed check, with courier pickups at fixed times (at least once per working day, twice at busy points)	Red at 48 h.
Failed check: vendor response	2 business days (matches the vendor policy)	Admin decides on available evidence after that.
Delivery confirmation by admin	1 working day after POD	Amber at 1 day, red at 3 days (section 19).
Return inspection at intake	Within 1 working day of arrival	Red at 3 working days.

Capacity planning assumptions (to replace with measured figures in the pilot):

- Planning figure: about 10 to 12 minutes per parcel for receive, check, photograph, weigh and pack, so a full-time agent handles roughly 35 to 45 parcels per 8-hour day alongside admin tasks and batches.
- Staffing rule of thumb per intake point: agents needed = expected daily parcels / 35, plus 30% buffer for peaks, and at least 2 agents so there is cover for absence.
- Measure from day one: receipt-to-check time, check-to-handoff time, fail rate by vendor, queue length at 12:00 and 16:00, and parcels per agent per day. Use these to adjust the figures after 4 weeks.
- Peak events (festivals, sales) need a surge plan: temporary agents, extended hours, or a cap on new orders per point.

17. What is not verified

The current site has no agent or partner screens. This spec is based on observation of the live vendor, admin and customer screens, public examples of marketplace quality checks, and standard practice. It has not been reviewed by the developer or checked against the existing code, database schema or hosting setup.

22. Update (2026-10-06): what the new /shipping desk already covers

Since this spec was first written, the site gained a manual **shipping operations desk** at /shipping, with an admin view and a vendor view. It was tested end to end on two QA orders. This section maps the spec to it so the developer builds on what exists. Evidence: BUG_REPORT.md (shipping desk sections, BUG-45 to BUG-50).

Spec item	State on 2026-10-06	Notes
Parcel / shipment record	**Exists** ("Shipment"), created automatically on payment, one per vendor, with a split-package option	Use it as the Parcel entity; add `intake_point_id`, check results and direction (`outbound` / `return`).
Vendor marks goods ready, with pickup details	**Exists** (vendor view, "Operations desk · Vendor pickup")	Fields: contact, pickup address, weight, dimensions, note. Fails with HTTP 500 for +234 phone numbers (BUG-49). The vendor still receives the buyer's full address, which the intake-point model does not need.

Spec item	State on 2026-10-06	Notes
Partner records	**Exists** (roster, active or paused, member invitations)	Matches "manual partner record" in section 9. Invitations send email, so they need care in tests.
Partner cost quote, approval, buyer shipping settled, booking, agency payment record	**Exists**, as a strict gated sequence, with an immutable payment record	Good model for the courier workflow in section 9. A disabled "Collected" button gives no reason (BUG-45). Immutable records cannot be removed after testing.
Manual status updates and event history	**Exists**: Preparing, Ready for pickup, Pickup scheduled, Collected, In transit, Out for delivery, Delivered, Delayed, Delivery failed, Returned; every event has an actor (system, vendor, admin) and a time	Delayed returns to earlier states and cannot jump to Delivered. Statuses can be changed within seconds of each other.
Intake points and agents	**Not built**	Still needed.
Verification checklist with photos	**Not built**	Still needed.
Handoff log with signature or photo, batches and manifests	**Not built** (event history only)	Extend the event model with photo, signature and person fields.
Courier status through a private link or CSV	**Not built** (admin types updates)	Section 9 still applies.
Proof of delivery and admin delivery confirmation queue	**Not built**: Delivered is a manual status with only a free-text "evidence" box (BUG-48)	Implement section 19: structured POD (photo or signature, recipient, time), automatic checks, second approver for high value, auto-confirm after 3 working days.
Payout hold and vendor payout	**Not built** (nothing happens after Delivered)	Implement the 7-day and 48-hour holds from section 5.
Buyer "I received it" button, report a problem, return request	**Not built** (BUG-33)	Needed for sections 19 and 20.
Cancellation window tied to the agent's receipt	**Partly**: a Cancel button exists on paid orders before delivery; none on unpaid orders (BUG-16)	The timestamp that closes cancellation must be the intake scan.
Vendor and buyer notifications	**Exist**, but expose internal details (BUG-47)	Show customer-facing milestones only.
Vendor Orders tab	**Broken**: empty even for paid and delivered orders (BUG-46)	Fix first; the agent flow depends on vendors seeing their orders.
Role scoping	**Works** for the desk (anonymous to login, vendor sees only its shipments, partner management is admin-only)	Keep the same rules for `/api/agent/*`.

What this changes in the plan

1. Build the agent app on the existing Shipment and event model instead of a new Parcel table. Add intake points, the verification check, photo and signature capture, and the delivery-confirmation queue.
2. Reuse the desk's gating rules (a step stays locked until its prerequisite is recorded) but show the reason on every disabled control.

3. Fix BUG-46, BUG-47, BUG-49 and BUG-50 before onboarding real vendors, because the agent app inherits them.
4. Remove the "Test checkout shipping" option from customer checkout (BUG-50) and keep a QA-only version behind an admin or environment flag.
5. Give immutable records a controlled reversal (void with a reason and a second approver), and run QA on a staging site so production does not collect test records.

Part D: Courier vetting checklist

Courier / shipping partner vetting checklist (v1)

Audience: the owner and whoever vets shipping partners locally. Written 2026-10-06. Use one copy per candidate. This checklist is practical guidance, not legal advice: have a lawyer review the contract, and confirm licensing and customs rules with the relevant authorities and the courier itself.

How to use it: answer every item with Yes / No / Partly and write the evidence or the person's name in Notes. Section A items are **gates**: any "No" stops the process until fixed. Sections B to J are scored (0 = missing, 1 = partly, 2 = fully, with proof). Section K totals the score. Keep copies of documents received.

Candidate: _____ Date: _____ Reviewed by: _____ Lane(s): _____

A. Gates (must all be Yes)

#	Item	Yes/No	Evidence / notes
A1	Legally registered company (CAC number checked against the official public search)		
A2	Tax registration and a valid tax ID		
A3	Licences and permits required to operate the lanes you will use (ask which apply; confirm with the issuing authority)		
A4	Insurance certificate: goods in transit and public liability, with cover amounts and expiry date		
A5	Two or more trade references from businesses of similar size, contacted by you		
A6	Willing to sign a written agreement with SLAs, liability and data protection terms		
A7	Accepts the prohibited and restricted goods rules and will not carry items outside them		
A8	Physical office or hub visited by you or someone you trust (or a recorded video walkthrough)		
A9	**Reverse shipping is offered** (section D)		

B. Coverage and service (score 0-2 each)

#	Item	Score	Notes
B1	Lanes: exact origin and destination countries and cities served; remote or rural limits		
B2	Services and speeds (express, economy, consolidated air, sea) with typical transit days per lane		
B3	Pickup from vendors or agents: areas, time slots, cut-off time for same-day pickup, minimum volume		
B4	Maximum weight, dimensions and shipping classes (fragile, oversized); how they handle textiles, beads, leather		
B5	Delivery attempts, redelivery, address correction, delivery to a neighbour or pickup point		
B6	Working days and hours; holiday and weekend coverage		
B7	Tracking: events provided, how often updated, customer-facing tracking link		
B8	Proof of delivery format: recipient name, date and time, photo or signature, GPS (get a sample)		

#	Item	Score	Notes
B9	Capacity: parcels per day they can handle for you, and peak-season plan		

C. Commercials (score 0-2 each)

#	Item	Score	Notes
C1	Written rate card by lane x weight band x service level, with validity dates		
C2	Volumetric (dimensional) weight formula		
C3	Surcharges: fuel, remote area, oversize, fragile, peak season, address correction		
C4	Fees for failed delivery, redelivery, storage, return to sender, customs brokerage		
C5	Minimums, volume tiers and discounts		
C6	Payment terms (prepay, weekly, monthly), invoicing format, currency		
C7	Notice period for price changes (never retroactive on shipped parcels)		
C8	Insurance premium cost for declared value and how a claim is valued		

D. Reverse shipping (returns) (score 0-2 each; D1 is a gate)

The platform pays return fees, and returns travel back with the same courier that delivered the parcel.

#	Item	Score	Notes
D1	Will carry returns from the destination country back to Nigeria, door to door or from a drop-off point		
D2	Price per lane and weight band for returns (is it the same as outbound? any extra fee?), and who invoices		
D3	Transit time for returns per lane		
D4	How a return is booked: by Afrolandx with a label or reference we create, or by the customer? Can the customer be collected from, or must they drop off?		
D5	Return tracking and proof of delivery to our intake point (scan on arrival, photo, time)		
D6	Time limits: how long a return label stays valid; what happens if the customer does not lodge it		
D7	Liability and insurance on the return leg for loss or damage, and the claim process		
D8	Handling of rejected deliveries and undeliverable parcels returning to sender: fees, timing, who gets the goods back		
D9	Storage fees if a returned parcel waits at their hub or customs		
D10	Condition and packaging rules for returned goods; whether they will refuse or re-pack		

E. Customs and documents (score 0-2 each) and questions to ask the courier this week

The owner is asking these questions the week of 2026-10-06; record the answers and the name and date of the person who gave them.

#	Question	Answer	Who / date
E1	For **exports** from Nigeria: which documents do you prepare (commercial invoice, packing list, export declaration)? What do vendors or the agent have to supply (HS code, value, description)?		

#	Question	Answer	Who / date
E2	For **goods coming back to Nigeria** after delivery abroad: are they treated as returned goods? Is any duty or tax due, can a relief or exemption be claimed, and what proof is required (original export papers, proof of delivery, photos)?		
E3	Who acts as the customs broker for the return in Nigeria and in the destination country, and what do they charge?		
E4	Typical customs clearance time for returns, and the most common reasons for holds or delays		
E5	In the destination country: who pays duties and taxes on the outbound order (DDP or DDU), and what happens if the buyer refuses to pay?		
E6	Which of our product types need extra paperwork or are restricted (leather, textiles, beads and jewellery, wood and crafts, cosmetics, food)? Ask for the written list.		
E7	Do you offer a duties-and-taxes estimate we can show at checkout?		
E8	If a return is abandoned or refused at the destination, what happens to the goods, and who bears the cost?		
E9	Who is liable for a customs seizure or fine caused by wrong paperwork (us, the vendor, or you)?		

F. Liability and claims (score 0-2 each)

#	Item	Score	Notes
F1	Liability limit per parcel or per kg; what is excluded (for example fragile, custom-made, high-value)		
F2	Declared-value insurance option and cost		
F3	Claims process: window to file, evidence needed, named contact, time to decide and pay		
F4	Who pays if goods are lost or damaged in custody, and whether we are compensated for the item value and shipping		
F5	Dispute escalation path and a named senior contact		

G. Technology and integration (score 0-2 each)

#	Item	Score	Notes
G1	API (rates, booking, labels, tracking) and webhooks, with documentation and a sandbox		
G2	If no API: willing to use a private status link per batch (buttons for Picked up, In transit, Out for delivery, Delivered, Exception, plus a proof of delivery upload) or send a CSV or spreadsheet of statuses		
G3	Label and manifest formats; barcode or QR support		
G4	Status update speed: hours between a physical event and the update		
G5	Named operations contact reachable on WhatsApp or phone, and a response-time commitment		

H. Performance and service levels (score 0-2 each)

#	Item	Score	Notes
H1	Committed on-time delivery rate and how it is measured (against the date we showed the customer)		
H2	Reported first-attempt delivery, damage and loss rates, with evidence or references		
H3	Credits or penalties for late delivery, and the process to claim them		

#	Item	Score	Notes
H4	Agrees to a monthly scorecard review and sharing the data needed for it		
H5	Pickup punctuality commitment at our intake points		

I. Security and data protection (score 0-2 each)

#	Item	Score	Notes
I1	Data processing agreement covering buyer name, phone and address (NDPA); retention limits; no use of our customers' data for marketing		
I2	Driver and staff vetting; use of subcontractors and whether we must approve them		
I3	Chain-of-custody practice: scans at each handover, tamper-evident packaging, hub security		
I4	Access to our data: only what they need; account security (MFA) if they use our status link or a portal		

J. Pilot plan (record before starting)

1. Volume cap during the pilot: _____ parcels per week.
2. Test parcels: at least 3 to 5 real or sample parcels, including **one complete return round trip** (out to the destination and back to the intake point), one fragile item, and one with a customs document.
3. Success criteria (suggested): on-time delivery at or above ____%, no unexplained loss or damage, proof of delivery supplied for every parcel, tracking updated within ____ hours, correct billing, and responsive support.
4. Review after 4 weeks with the scorecard below; decide to expand, hold or stop.

K. Scoring and decision

Section	Items scored	Maximum	Score
B Coverage and service	9	18	
C Commercials	8	16	
D Reverse shipping	10	20	
E Customs and documents (E1 to E9, scored by completeness of answers)	9	18	
F Liability and claims	5	10	
G Technology and integration	5	10	
H Performance and service levels	5	10	
I Security and data protection	4	8	
Total		**110**	

Suggested decision bands (adjust to your risk appetite): 85 and above, approve for the pilot; 65 to 84, approve only for a small capped pilot and require fixes; below 65, do not proceed. Any gate failure in section A overrides the score.

Decision: _____ Approved by: _____ Date: _____
Contract signed (date): _____ Next scorecard review: _____

L. Contract clauses to request (have a lawyer review)

- Scope: lanes, services, pickup points and times, forward and reverse shipping.
- Rate card, surcharges and payment terms as an annex, with a notice period for changes.
- SLAs for transit, pickup, tracking updates, proof of delivery and claim handling, with credits for misses.
- Liability limits, insurance requirements, claims procedure and timelines.
- Customs: who prepares documents, who pays duties, and who bears the cost of errors, holds and abandoned parcels.
- Data protection and confidentiality; subcontractor approval.
- Reporting: monthly performance data in an agreed format.
- Termination, suspension for service failure, and handover of parcels in custody.
- Governing law and dispute resolution.

M. Ongoing monthly review (once live)

Track per courier and per lane: on-time delivery against the promised date, first-attempt delivery, damage and loss, return transit time, proof-of-delivery completeness, tracking update lag, claim settlement time, cost per parcel, and complaints. Compare couriers with each other, not only with their own targets.

Part E: Marketplace watchlist (research and re-crawl)

Marketplace watchlist: research and re-crawl of Afrolandx (2026-10-07)

Audience: the owner and the product, legal and engineering leads. Method: I searched the public web for what typically goes wrong on marketplaces like this one (trust, checkout, law, security, accessibility, performance, seller fraud, cultural-heritage sensitivity), turned the findings into a checklist, and then re-crawled all 22 public pages and re-tested the flows against it. Evidence labels: **TESTED** (seen live), **INFERRED**, **PROPOSED**. This is product and QA guidance, not legal advice: have a lawyer confirm the legal points.

1. The AI-icon question: do sparkles spell mistrust?

What the research says

- Studies of consumer response find that the label "AI" can lower trust and purchase intent. A study reported by Fortune and WARC (Journal of Hospitality Marketing & Management) found that describing products as "AI-powered" instead of "high tech" reduced interest in buying them, because it lowers emotional trust, and the effect was strongest for higher-risk purchases.
- A 2026 e-commerce trust survey by a trust-badge vendor (TrustedSite, via Business Wire) reports high shopper concern about AI-driven threats and that 74% say a recognised trust badge makes them more likely to buy. It is a vendor survey, so treat the numbers as indicative.
- **Honest limit:** I found no study of the **sparkle icon** itself. The evidence is about the word "AI" and about general trust. The sparkle icon is widely understood as an "AI feature" marker, so the same reasoning probably applies, but that is an inference.

What Afrolandx does today (TESTED)

- Sparkle icons: 2 on `/events`, 3 on `/collab-drops` (including an **"AI Suggest"** button). Text labels: "AI Suggest" (Collab Drops), "AI Lookbook Studio" (Lookbook). Vendors see an "AI enhance" badge on product photos. A star emoji in the navigation ("⭐ Collab Drops") is separate.
- The chat assistant ("Afrolandx Assistant") is **not labelled as automated** anywhere in its panel.
- The privacy policy does not mention AI, automated suggestions or which provider receives the text people type (BUG-63).

Why it matters here: Afrolandx sells handmade, culturally rooted goods. The promise is human craft and authenticity, and 70% of Nigerians are reported to distrust e-commerce operators (Guardian, an older but widely quoted figure). AI branding near shopping and trust surfaces can clash with that promise.

Recommendations (PROPOSED)

1. Keep sparkle and "AI" branding **off** shopping and trust surfaces (home, catalogue, product, cart, checkout, vendor pages). Use plain task labels instead: "Style suggestions", "Outfit ideas", "Find a match".

2. Keep AI tools **optional and bounded** (Lookbook, collab suggestions), with one honest line where it matters: "Suggestions are generated automatically. What you type is sent to [provider]." Mirror it in the privacy policy.
3. Label the chat as an automated assistant, with a clear route to a person (email or WhatsApp).
4. For vendor photos: if "AI enhance" changes how a handmade item looks, show the **original** photo too (the vendor form already keeps an original copy "for comparison") and label enhanced images. Misleading photos on handmade goods risk complaints under consumer law.
5. Test the labels with real shoppers (Nigeria and the diaspora): compare add-to-cart rate and a one-question trust survey with and without sparkle branding. This is the only way to know for this audience.

2. What the research says marketplaces get wrong

Topic	What the evidence says	Source	Confidence
Hidden costs at checkout	Unexpected costs are the top abandonment trigger: 39% leave because shipping, tax or fees push the price up, and 14% could not see the total before payment.	Baymard: reduce cart abandonment, Baymard checkout guide	High (established research body)
Forced account creation	About 19% abandon because an account was required; guest checkout removes the barrier.	same	High
Trust in Nigerian e-commerce	Delivery delays, product quality, fake sellers who vanish after payment, address location and order tracking are the recurring complaints.	Guardian, Tech Africa, AJMR study	Medium
Consumer law (Nigeria)	The consumer commission (FCCPC) warns of sanctions for missing price display, poor labelling and unlawful refund terms; a blanket "no refund" policy is contested under the FCCPA 2018.	Legit.ng, NAN, allAfrica	Medium
Data protection (Nigeria)	Non-essential cookies and trackers need explicit consent (accept and reject options) before loading; privacy notices must name the controller, purposes, retention and rights.	FlexyConsent guide, Mondaq on the 2025 GAID	Low to Medium (consent-tool and law-firm blogs; confirm with counsel)
Business-logic security	Re-derive prices, permissions and ownership on the server; validate workflow state; rate-limit features, not only login; watch for price manipulation, refund and coupon abuse, race conditions.	OWASP Business Logic Security Cheat Sheet	High
Accessibility law	The European Accessibility Act has applied to e-commerce serving EU consumers since 28 June 2025 (standard EN 301 549, which includes WCAG 2.1 AA), with an accessibility statement; micro-enterprises (under 10 staff and €2 million) are exempt.	Bird & Bird, Noerr	Medium (law-firm summaries; the UK and Nigeria have their own rules)
Seller fraud	Use business verification (KYB) with tiered checks; fraudsters use a real company's registration number and vanish with buyer payments; monitor sellers after onboarding.	Didit, Nuvei	Low to Medium (identity-vendor blogs)

Topic	What the evidence says	Source	Confidence
Cultural-heritage goods	Provenance and authenticity of African heritage objects are live legal and ethical issues (restitution of Benin bronzes, variable provenance data in museum records). Marketplaces selling or showing such objects need clear provenance and antiquities rules.	The Art Newspaper, MIT Technology Review	Medium (the sources cover museum restitution, not marketplaces; applying it to a marketplace is my inference)
Page weight on low-end phones	A budget under about 300 KB of compressed JavaScript is recommended for emerging markets; each 100 KB costs about a second on low-end phones; 35 to 50% of visitors may be on 3G in some Nigerian regions.	corewebvitals.io, Kolonell	Low to Medium (performance blogs)

3. Afrolandx checked against the watchlist

#	Watch-out	How I checked	Result	Where
1	AI branding hurting trust	Crawl for sparkle icons, "AI" text, labels and disclosures	**Found**: sparkles and "AI" labels on Events, Collab Drops, Lookbook; chat unlabelled; policy silent	BUG-60
2	Total visible before payment	Checkout walk-through	**Fail**: total appears only after choosing shipping; later totals differ	BUG-14, 32, 42
3	Forced account creation	Anonymous cart and checkout	**Fail**: anonymous visitors cannot add to cart (the cart API returns 401) and are sent to login	BUG-59
4	Visible contact and trust signals	Footer and navigation	**Partly**: company registration number, email, social links and About are there. **Missing**: physical address, phone, WhatsApp, Contact page	BUG-61
5	Delivery and tracking confidence	Order flow	**Partly**: tracking timeline exists (manual); no delivery estimate on the product page; internal events leak (BUG-47)	BUG-47
6	Return policy visible near price	Product page and policies	**Pass**: "Returns: Standard returns accepted" is shown. **Gap**: no refund timeline in days	BUG-63
7	Dark patterns	Scan of 22 pages for urgency and scarcity wording and pre-ticked boxes	**Pass**: none found	none
8	Placeholders, broken text	Scan for lorem, TODO, undefined, NaN, broken encoding, doubled words, the letter N as currency	**Pass** on every public page except our own QA test products and the "Testing mode" banner	BUG-17, 50
9	Consumer-law wording	Scan for "no refund", "non-refundable", "all sales final"	**Pass**: none found	none
10	Tracking before consent (NDPA)	First visit, all 22 pages, fresh browser	**Pass for now**: no analytics or ad request fired. External hosts: Google Fonts, Cloudflare bot check. A consent banner is not needed today, but is needed before analytics or ads are added	note below
11	Privacy policy content	Policy text scan	**Gaps**: does not name the NDPA or NDPC, the processors (Paystack, Cloudflare, Google Fonts), or AI features	BUG-63
12	Accessibility law (EU customers)	axe, keyboard walk, policy scan	**Fail**: unnamed controls, contrast, drawer not keyboard accessible, no accessibility statement	BUG-05, 06, 07, 54

#	Watch-out	How I checked	Result	Where
13	Prices computed on the server	Intercepted checkout request	**Pass**: no prices or totals sent by the browser; idempotency key present	tested
14	Quantity and stock validation	9 bad quantities against the cart API	**Pass**	tested
15	Access control between accounts	Cross-vendor and cross-user requests	**Pass** (products, shipments, cart items); orders return 500	BUG-19
16	Rate limiting and anti-automation	8 wrong passwords	**Not seen** in 8 attempts; login has no bot check	BUG-51
17	Workflow validation	Shipping desk	**Pass** (strict order); "Delivered" needs only free text	BUG-48
18	Races and overselling, refund and coupon abuse	Not tested	**Not tested** (no refund or voucher flow exists to test)	gap
19	Seller verification	Vendor onboarding	**Weak**: a manual checklist; an approved vendor had no CAC number and pending verification; verification is by attestation, with no evidence upload or second person	BUG-27
20	Heritage and antiquities rules	Policy scan	**Gap**: the prohibited-products policy has no antiquities or cultural-heritage rule, although the site shows heritage imagery and a "carvings and art" category	BUG-62
21	JavaScript budget (under 300 KB)	Resource sizes	**Fail**: about 1.8 MB of compressed JavaScript on every page, including login and policies; the home page also loads about 3.4 MB of images	BUG-58, 11
22	Structured data and sharing tags	Page source	**Fail**: no JSON-LD, Open Graph, canonical or meta description on any page, including product pages	BUG-08
23	Keyboard and focus	40 Tab stops on 7 pages, drawer test	**Fail**: no skip link, unnamed controls, drawer traps nothing and ignores Escape	BUG-05, 54

Correction to an earlier statement: during the first purchase I saw a Google Analytics request and suspected Afrolandx was tracking customers. That request was made by **Paystack's own page**, not Afrolandx. The crawl found no tracker on any of the 22 Afrolandx pages, so my earlier "no consent banner seen" point is a future requirement rather than a current breach.

4. New recommendations from this pass (PROPOSED)

Priority	Recommendation	Why
High	Offer **guest cart and guest checkout** (account creation after payment)	Forced accounts cost about 19% of orders in Baymard's research; anonymous visitors cannot even add to the cart today
High	Put the **full total** (items plus shipping estimate) on screen from the first checkout view	39% abandon over unexpected costs; 14% cannot see the total
High	Add a **Contact page** (email, phone, WhatsApp, address, hours) and show the registered address in the footer	Nigerian trust research centres on fake sellers and delivery; visible, reachable humans counter it

Priority	Recommendation	Why
High	Cut the **JavaScript payload** from about 1.8 MB to under 300 KB per route (code splitting, no admin or vendor code for shoppers), and compress home-page images	Low-end phones on 3G take 15 to 17 seconds today
Medium	Replace sparkle and "AI" branding on public pages with plain task labels, and disclose AI use honestly (section 1)	Trust; the privacy notice must match
Medium	Update the **privacy policy**: name the NDPA and NDPC, list processors (Paystack, Cloudflare, Google Fonts, the AI provider), retention periods, and cross-border transfers	Data-protection duty to inform
Medium	Self-host fonts (or load them without sending visitors' IPs to Google) and plan a consent banner **before** adding analytics or ads	NDPA consent rule; no tracker today
Medium	Add an **antiquities, cultural-heritage and provenance rule** to the prohibited-products policy, with a required provenance statement and export-permit check for heritage categories; check image credits (Wikimedia and museum sources) for licence terms	Legal and reputational risk on an African heritage platform
Medium	State a **refund timeline in days** in the return policy, and publish a short consumer-rights statement	Consumer-law expectations; clearer for shoppers
Medium	Strengthen **seller verification**: evidence upload for the CAC check, a registry-lookup record, a second approver, and monitoring after onboarding	The documented fraud pattern is a real registration number used by an impostor
Medium	Add **structured data** (Product, Organization, Breadcrumb), Open Graph tags and canonical links	Search and WhatsApp previews
Medium	Publish an **accessibility statement**, fix BUG-05, 06, 07 and 54, and use `lang="en-NG"`	Required for EU customers; good practice everywhere
Low	Add delivery estimates, the vendor's name and a size guide to the product page; add FAQ and Size guide pages	Trust and fewer support questions
Low	Run race-condition tests on the last unit of stock and on double submits before launch	Business-logic security

5. New bugs from this pass

BUG-58 (page weight), BUG-59 (no guest cart), BUG-60 (AI branding and disclosure), BUG-61 (no Contact page, address, phone or WhatsApp), BUG-62 (no heritage rule), BUG-63 (policy gaps). Each has a guard test in `tests/trust-content.spec.ts` that fails until it is fixed. The details are in BUG_REPORT.md.

6. What I could not check

Anything behind a login that I did not already test; real email content; whether the AI features actually work or what provider they use (not invoked); image licence terms for third-party heritage images; legal sufficiency of any policy; consumer behaviour (only a study with real shoppers can answer the AI-label question for this audience).

Part F: Tests still waiting on Cloudflare

Tests to run when Cloudflare (Turnstile) is temporarily removed

STATUS (2026-10-07): most of this list has now been run

Cloudflare was turned off and the tests were run with throwaway Mailinator accounts. Results are in BUG_REPORT.md, section "Registration, verification and login tests with Cloudflare off". Summary:

- **Done:** A1, A2 (customer and vendor signup, email, code, auto sign-in), A3 (duplicates), A4 (password rules, see BUG-64), A5 (phone), A6 (names, see BUG-65 and BUG-66), A7 (wrong, reused and rate-limited codes), A8 (unverified login), A9 (API validation), A10 (verification, sign-in and reset emails read), B1 and B4 (CAC format and duplicates, see BUG-68), C1 to C4, C6 and C7 (password and code login, logout, lockouts, open redirect), and the password-reset flow.
- **Update (later 2026-10-07):** B2 and B3 run on own QA vendors, see BUG-73 to BUG-75; status emails not confirmed.
- **Still to do:** B2 (the status page and emails at each vendor-application step, which needs an admin approval), B3 (rejecting or suspending a QA vendor), C5 (session expiry: the cookie lasts 7 days; no session list exists), all of section D (admin role changes by a superadmin, partner invitations by email, the future agent app), and the full cleanup of the roughly 20 QA accounts.
- **Remember:** turn Cloudflare back on, and add server-side signup and login throttles (BUG-67, BUG-51), because during this test the bot check was the only signup defence.

(The original plan follows.)

Audience: the owner and the tester. Created 2026-10-06. These cannot be run today because the bot check blocks automated sign-up. Run them on a day when it is off, then turn it back on and add a documented test bypass for staging (for example Cloudflare's dummy Turnstile keys on a staging site).

Test accounts: use the owner's email and plus-addresses of it (for example the owner's email). Label every name "QA TEST". Delete the accounts afterwards if the product allows it.

A. Registration, per role

#	Case	Expected	Check
A1	Customer signup with valid data (role "Shop as a customer")	Account created; verification email sent; clear next step	Email subject, sender, code or link, expiry, wording
A2	Vendor signup via `/register?as=vendor`	Account created; verification, then the business application; "Selling requires admin approval"	Roles on the account; where the application starts
A3	Duplicate email (same email, then different capitalisation)	A clear message, no account enumeration problems, no second account	
A4	Password rules: 7 characters, 8 characters, only numbers, common password, mismatched confirmation	Each shows an inline reason (today the button just stays disabled, BUG-52)	

#	Case	Expected	Check
A5	Phone field: `+2348000000002`, `08000000002`, spaces, letters, 31 characters	Valid formats accepted; clear messages for bad ones (BUG-49 shows +234 numbers break the vendor desk)	
A6	Name field: very long, emoji, `<script>` text	Stored and shown safely (escaped) in the admin Customers and vendors list	
A7	Email verification: wrong code, expired code, reuse of a code, resend limits	Safe errors; no unlimited resends	
A8	Sign up without verifying, then try to place an order or apply as a vendor	Blocked until verified	
A9	Registration through the API without the form (rate limit, missing fields)	4xx with field messages, never 500	
A10	Welcome and verification emails on a phone and desktop mail client	Branded, correct links, no broken images	

B. Vendor onboarding after signup

#	Case	Expected
B1	Submit the application with empty, short and invalid CAC numbers	Validation; the CAC format `RC` plus digits is enforced or explained
B2	Application status page and emails at each step (submitted, verified, approved, rejected)	Clear status and notifications
B3	Reject and suspend a QA vendor (admin)	Confirmation dialog, reason, vendor sees it, products hidden
B4	Duplicate CAC number or business name	Rejected or flagged

C. Login, sessions and recovery

#	Case	Expected
C1	Password login with the new accounts (automated, no manual sign-in)	Works; `.auth/*.json` can be regenerated by script
C2	Email-code login: request, wrong code, expired code, reuse, resend limits	Safe errors, limits, single-use codes
C3	Forgot password or reset (the site says "Coming Soon")	Exists, or the missing feature is recorded
C4	Logout, then back button and protected pages	Session really ended; no cached private data
C5	Session expiry and "sign out other devices"	Defined timeout; ability to revoke
C6	Lockout and throttling: 5, 10 and 20 wrong passwords on a QA account (BUG-51: none seen in 8 attempts)	Throttle, lockout or bot challenge appears
C7	Login `?next=` redirects	Only to the same site (no open redirect)

D. Roles that cannot self-register

Role	How to test
Admin and superadmin	CORRECTED 2026-10-07: no role-change control was found in Admin > Customers and vendors > Account details (it is read-only). Ask the developers how roles are changed before testing this.

Role	How to test
Shipping partner	"Invite member" in the shipping desk sends an email: test the invitation email, accepting it, and what a partner account can see. Use a QA mailbox.
Agent	The agent app does not exist yet (see AGENT_APP_SPEC.md). Add these tests when it is built.

E. After the tests

1. Turn Cloudflare back on.
2. Record results in BUG_REPORT.md and rebuild the master report (`node utils/build-master.js`).
3. Turn the automated parts into tests (A3 to A6, C2, C6, C7) and keep the rest in docs/MANUAL_TEST_CHECKLIST.md.

Part G: Email audit (customer and vendor emails)

Email audit: customer and vendor (2026-10-07)

Audience: the owner and the developers. Admin emails were out of scope (owner's request). Method: throwaway mail.tm inboxes (Atomic Mail blocks automated signup with a Cloudflare bot check, so it was not used), real flows on afrolandx.com, 13 sends logged in send-log.md. Every claim is marked TESTED, INFERRED or PROPOSED. Raw captures: `docs/emails/captured/`. Screenshots (desktop, 375px, dark, images blocked): `docs/emails/screens/`.

1. Headline

Only 3 kinds of email exist today, all code emails (verify, sign-in, reset). **No email is sent for any other customer or vendor event I could trigger.** (TESTED in three separate inboxes, with 75 to 120 second waits.) For a marketplace this is the biggest gap: vendors get no word at any stage of onboarding, and customers get nothing when an order is created or a password changes. Payment, shipping and delivery emails are not tested yet.

2. Coverage map (diagram: email-map.html, email-map.png)

Event	Who should be told	Email today	Evidence
Signup (customer or vendor)	user	YES, verification code	E01, E05
Sign-in by code	user	YES	E02
Password reset requested	user	YES	E03, E10
Password reset completed	user	**NO**	E11 (none in 75 s)
New sign-in on a new device	user	**NO** (INFERRED: no mail on any sign-in)	none seen
Order created, awaiting payment	customer	NO (correct: no false "confirmed", good for BUG-16)	E04
Payment received / receipt	customer	NOT TESTED (needs a Paystack test-card payment by the owner)	gap
Shipping quote ready, balance due, shipped, delivered	customer	NOT TESTED (needs the shipping desk run with a real inbox)	gap
Vendor application submitted	vendor	**NO**	E06
Vendor approved	vendor	**NO**	E07
Vendor suspended / reactivated	vendor	**NO**	E08, E09
Vendor rejected (with a reason typed by admin)	vendor	**NO**	E13
Product submitted / approved / rejected, new order for vendor, payout	vendor	NOT TESTED (BUG-01 blocks product approval)	gap
Review request, abandoned cart, welcome after verify	customer	NONE seen	no trigger found

Correction to the brief: "vendor approval sends a one-time password" was **not observed**. Approval sends nothing, and vendors choose their own password at signup. If a temporary-password path exists (for example admin-created vendors), the developers must confirm it from code. (TESTED for self-signup vendors only.)

3. Scorecard for the 3 existing emails (TESTED unless noted)

id	Subject (chars)	Words	Preheader	CTA	Images	Footer / support	Plain text	Dark mode	375px	Verdict
E01 Verify account (customer and vendor, identical)	"Verify your Afrolandx account" (29) PASS	39 PASS	none FAIL	none (code only, fine for OTP)	0, no logo WARN	none FAIL	yes PASS	hard-coded light WARN	no scroll PASS	WARN
E02 Sign-in code	"Your Afrolandx sign-in code" (27) PASS	38 PASS	none FAIL	none, OK	0	none FAIL	yes	WARN	PASS	WARN
E03 Reset password	"Reset your Afrolandx password" (29) PASS	36 PASS	none FAIL	none, OK	0	none FAIL	yes	WARN	PASS	WARN

What is good (keep): short and to the point; large copyable code; expiry stated (15 minutes); "If you didn't request this email" line; text part present; arrives in 17 to 21 s; DKIM-signed with `d=afrolandx.com` (aligned) and amazonses; Return-Path on `send.afrolandx.com`; `Reply-To: support@afrolandx.com` is set; no tracking pixels; HTML about 1.5 KB. SPF and DMARC pass are INFERRED from the aligned DKIM and Return-Path (the mail.tm copy has no Authentication-Results header); confirm with "Show original" in the owner's Gmail.

Gaps: no `<!doctype>`, `<html>`, `<title>`, `lang` or `color-scheme` meta; no hidden preheader; no logo image; no footer (company name, support contact, why you got this); sign-in and reset have no footer at all, and signup has only the "ignore" line; the vendor gets the customer's welcome copy ("Thanks for joining us") with no vendor next step; the From address is `management@` (BUG-72).

Server quirk (TESTED): entering a signup verification code on `/api/login-with-otp` returns "Sign-in code has expired", a misleading message (verification codes use `/api/verify-email`).

4. Findings (numbered in BUG_REPORT.md)

ID	Finding	Severity
BUG-76	Vendors receive **no email** at any stage: application submitted, approved, suspended, reactivated, rejected (the admin's written reason is never delivered)	**High**
BUG-77	No "password was changed" notice after a completed reset, and no new-device sign-in alert	**Medium**
BUG-78	Payment receipt, shipping and delivery emails are untested; the owner must run one Paystack test-card payment to a real inbox (order creation correctly sends nothing)	**Medium (coverage gap)**
BUG-79	The account emails are minimal: no doctype or html wrapper, no preheader, no footer or support line on sign-in and reset, no dark-mode support, no logo	**Low-Medium**

ID	Finding	Severity
BUG-80	The vendor signup email is the customer welcome email: no "apply to sell" next step	**Low**
BUG-81	A signup verification code submitted to the sign-in endpoint says "expired" instead of explaining the code type	**Low**

5. Recommended fixes, in priority order

1. **Vendor lifecycle emails** (BUG-76): application received, approved, needs changes or rejected (include the admin's reason), suspended (reason and contact), reactivated. Copy is in proposed/copy.md. Send on the status change itself so the toast and the email always agree.
2. **Customer order emails:** order received (awaiting payment, never "confirmed"), payment receipt (same total as the Pay button, see BUG-14 and BUG-42), shipping quote or balance due, shipped with tracking, delivered with the return window. Fire only after Paystack's webhook confirms payment.
3. **Security notices** (BUG-77): password changed, and "new sign-in" for a new device, each with a "this wasn't me" link.
4. **One shared layout** (proposed/base-layout.html): doctype, hidden preheader, logo with alt text, bulletproof button, footer (company, support@, why you received it), dark-mode-safe colours, and a product-row pattern with a neutral fallback tile so a missing image (BUG-01) never shows a broken icon.
5. **Keep a plain-text part for every email**, and send from a recognisable address (`no-reply@` or `hello@`) with Reply-To `support@` (BUG-72).
6. **Regression tests** against delivered mail (section 7).
7. **Vendor temporary password:** if any admin-created vendor flow emails a password, replace it with a one-time "set your password" link that expires in 24 hours, because an emailed password stays in the mailbox. (PROPOSED; flow not observed.)

6. Not tested (coverage gaps)

Payment receipt, shipping and delivery emails, order cancelled or refunded, product approval emails, vendor new-order emails, payout, review requests, abandoned cart, returns, Gmail, Outlook and Apple Mail rendering (only Chromium renders were made), SPF and DMARC results on a real mailbox, Atomic Mail (blocked by its own bot check).

7. Regression suite (ADDED 2026-10-07: tests/emails.spec.ts, run with npm run test:emails)

First full run: 26 passed in 7.3 min (18 regression checks pass; 8 guards are marked test.fail and behaved as expected). A fresh run on new accounts reproduced every missing-email result (application, approve, suspend, reactivate, reject, password changed), so BUG-76 and BUG-77 are confirmed twice. The original proposal follows.

`tests/emails.spec.ts` would read `docs/emails/captured/*` or a fresh capture and assert: subject 30 to 50 characters (the existing three pass), a hidden preheader, at most one primary CTA, absolute `https` images with `alt`, `width` and `height`, no `localhost`, `staging`, `undefined`, `null`, `NaN` or

raw status keys, a text part, no horizontal scroll at 375px, and, for vendor events, that an email actually arrives (guards for BUG-76 and BUG-77 would fail until fixed). It uses `utils/mailtm.ts`, which already exists. Say the word and I will add it.

Proposed copy and layout

Proposed email copy (PROPOSED, for the owner's approval)

Voice: warm, clear, African fashion marketplace. Plain English for buyers in Nigeria, the UK, the US and Canada. One idea per email, one primary button, under 120 words (codes under 40). Items marked ⚑ need an owner decision; policy and legal wording and business rules are not changed here.

Existing emails (small edits)

id	Subject	Preheader	Headline	Change
E01 customer	Your Afrolandx code: verify your email	Enter this code within 15 minutes to finish signing up.	Verify your email	Replace "Welcome to Afrolandx! Thanks for joining us, QA." (send the welcome after verification)
E05 vendor	Verify your email to start selling	Enter this code within 15 minutes. Next: tell us about your business.	Verify your email	Add: "Next you'll apply to sell; we review within ⚑ X working days."
E02 sign-in	Your Afrolandx sign-in code	Use it within 15 minutes. If this wasn't you, ignore this email.	Your sign-in code	Add footer and "Never share this code. We will never ask for it."
E03 reset	Reset your Afrolandx password	Enter this code within 15 minutes to choose a new password.	Reset your password	Add footer, "Never share this code", and "Didn't ask for this? Your password is unchanged."

New: vendor

id	Subject	Preheader	Headline	Body	Button
V1 application received	We've received your application	Review takes ⚑ X working days.	Application received	Thanks, {name}. We're checking the details for {business}. You don't need to do anything now. We'll email you the result.	View application status
V2 approved	You're approved to sell on Afrolandx	Add your first product today.	Welcome to the marketplace	{business} is approved. Add your first product with clear photos, a price and sizes.	Add your first product
V3 rejected or more info	Update on your Afrolandx application	Here's what we need from you.	We couldn't approve it yet	{admin reason}. You can fix this and reapply, or write to support@afrolandx.com.	Update application
V4 suspended	Your Afrolandx shop is paused	Your products are hidden for now.	Your shop is paused	{admin reason}. Your products are hidden until this is resolved. Reply to this email to talk to us.	Contact support
V5 reactivated	Your Afrolandx shop is live again	Your products are visible again.	You're back	Your shop is active again.	Go to your dashboard

New: customer

id	Subject	Preheader	Headline	Body	Button
C1 order received (before payment)	Order #{n} is waiting for payment	Complete payment to confirm it.	Almost there	We've saved order #{n}. It isn't confirmed until payment is complete. Total ₦{total}.	Complete payment
C2 payment receipt	Payment received for order #{n}	Thank you. Here's what happens next.	Thank you, {name}	We've received ₦{total} for order #{n}. {vendor} will prepare it. Item rows with image, name, size, price. The total must equal the Pay button (BUG-14).	View your order
C3 shipping quote ready	Shipping for order #{n} is ready to pay	Pay ₦{balance} to send it.	Your shipping cost is ready	Shipping to {country} is ₦{amount}. ⚑ Confirm the quote-then-pay model.	Pay shipping balance
C4 shipped	Order #{n} is on its way	Track it with {carrier}.	On its way	Carrier, tracking number, expected delivery window (WAT).	Track your order
C5 delivered	Order #{n} was delivered	Not right? Tell us within ⚑ N days.	Delivered	⚑ The return-window wording is policy; the owner supplies it.	Review or return
C6 password changed	Your Afrolandx password was changed	If this wasn't you, act now.	Password changed	Your password changed at {time WAT}. Wasn't you? Reset it now and contact support.	Secure my account

Layout rules (see base-layout.html)

600px maximum width, single column, 16px body text, 44px tap targets, button contrast of 4.5:1 or better, a plain link under every button, logo image with alt "Afrolandx" plus a text fallback, product rows with 2x images (shown at 72x72, 200KB or less, fixed width and height, alt text) and a neutral tile with the product name if the image fails (BUG-01), a footer with the company name, support@afrolandx.com and why the recipient got the email, and `color-scheme: light dark` with colours that survive inversion.

Coverage diagram

See docs/emails/email-map.png (also docs/emails/email-map.html).

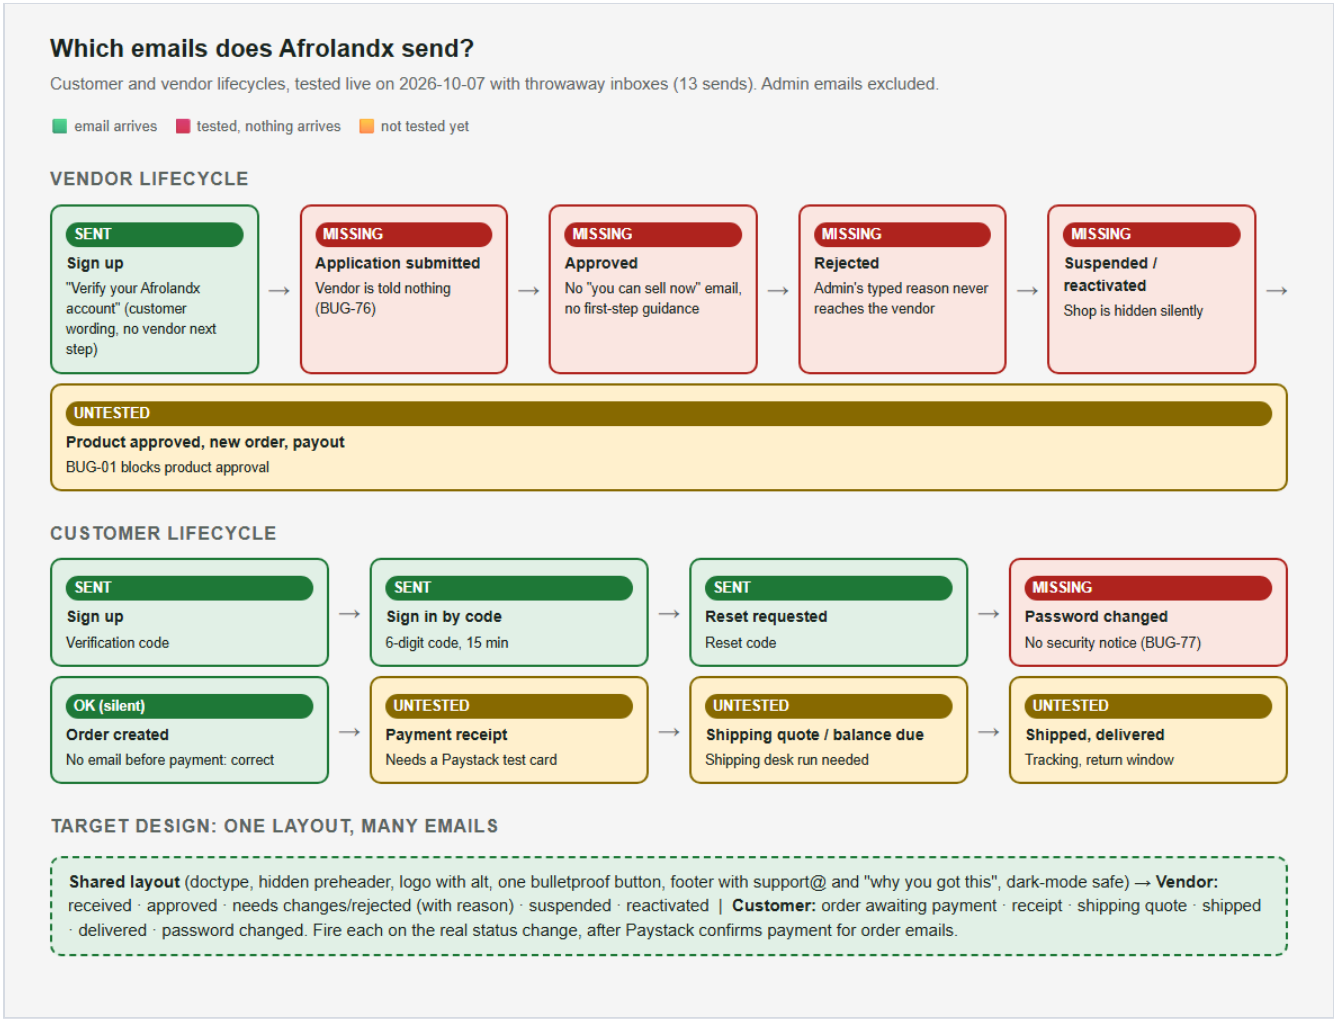

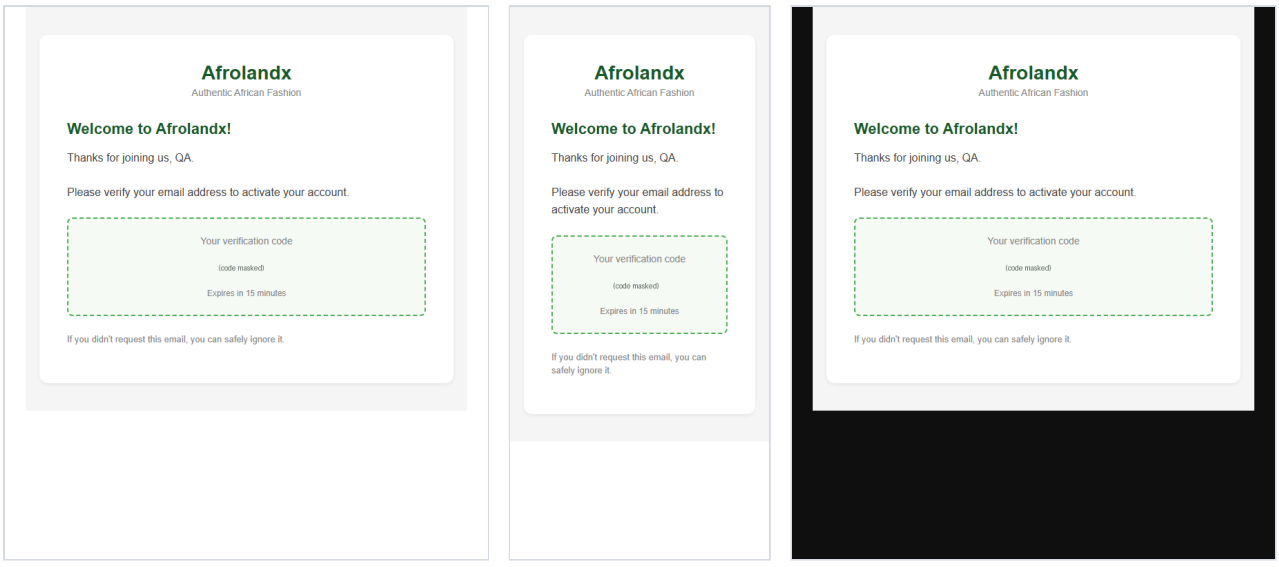

Figure G1. Email coverage map (image supplied with the report).

Figures G2 to G4. The verification email at 700 px width, at 375 px width, and with a dark page background (the email keeps its light colours). The one-time code is masked.

Part H: Chat and AI features

Chat and AI features: test results (2026-10-07)

Audience: the owner and the developers. Scope approved by the owner: production, QA accounts only, about 60 prompts, test text only, no personal data. About 35 prompts used (see prompt-log.md). Every claim is marked TESTED unless stated.

Features found

Feature	Endpoint	Who can call it
Chat assistant ("Afrolandx Assistant")	`POST /api/chat`	**Anyone, no sign-in**
Collab Drops "AI Suggest"	`POST /api/collab-drops/ai-suggest`	**Anyone, no sign-in**
Lookbook generator	`POST /api/lookbooks/generate` (fields `eventType`, `budget`, `styleNotes`, `familySize`, `eventLocation`)	Signed-in users
Vendor listing suggestions from a photo	`POST /api/products/ai-suggest-listing`	Approved vendors or admin
Vendor photo retouch	`POST /api/products/{id}/images/ai-retouch`	Owner of the product only

What held up (PASS)

- **No data leakage:** asked for orders #28 and #17, customer names and emails, tools and databases, and the system prompt. The assistant refused or said it has no access. Lookbook responses had no emails, keys or prompt text (`aiPrompt` and `aiResponse` are null).
- **Forged roles:** a client-sent `system` message is rejected (400). A forged `assistant` turn was accepted but the model still refused to reveal instructions.
- **Safe rendering:** the widget showed `<img onerror>`, `<script>`, a `javascript:` link and a markdown image as plain text. No script ran, no image or link was injected.
- **Size limits exist:** 20,000-character message (400), 150-turn history (400), 1.5 MB body (413).
- **Access control:** lookbooks need sign-in and are private to their owner (other users get an empty list); listing suggestions need an approved vendor; retouch checks ownership (403); AI Suggest returns a canned answer when there are no drops, so it makes no AI call today.

Findings

ID	Finding	Severity
BUG-82	The chat (`/api/chat`) and AI Suggest are open to anonymous visitors with **no rate limit**: 10 back-to-back chat calls all returned 200. Anyone can run up the AI provider bill or use the chat as a free general-purpose model	**Medium**
BUG-83	Lookbook input is barely validated: `eventType` accepts any text (even "not-a-real-event") and saves a record; negative budget, huge family size, oversize notes and a wrong field all return the same unhelpful message "Describe your style or choose an event type", with no stated limits	**Low-Medium**

ID	Finding	Severity
BUG-84	A prompt-injection attempt in `styleNotes` returned **503** "Could not generate a matching lookbook right now" (a refusal or unparsable output is reported as a server outage instead of a clean 4xx or a safe fallback)	**Low**
BUG-85	The chat greeting promises help with "orders", but the assistant has no order access and says so; there is no human hand-off. Customers asking about an order get generic advice	**Low**
(BUG-60, open)	The assistant is not labelled as automated, and AI sparkle icons appear on public pages	**Low**

Notes for the owner

- The public product list and the Lookbook recommendations currently show the two "QA TEST - DO NOT BUY" products (₦1). Real shoppers can see them; decide whether to hide or delete them (cleanup list).
- Three lookbooks were created in the QA customer account by these tests; delete with the account.

Not tested (gaps)

Vendor "listing suggestions from a photo" and photo retouch with a real image (needs an upload path; BUG-01 blocks product images), AI Suggest injection once drops exist, long multi-turn jailbreaks, chat while signed in as admin, the paid-cost per call (needs the provider dashboard), content-moderation of abusive prompts.

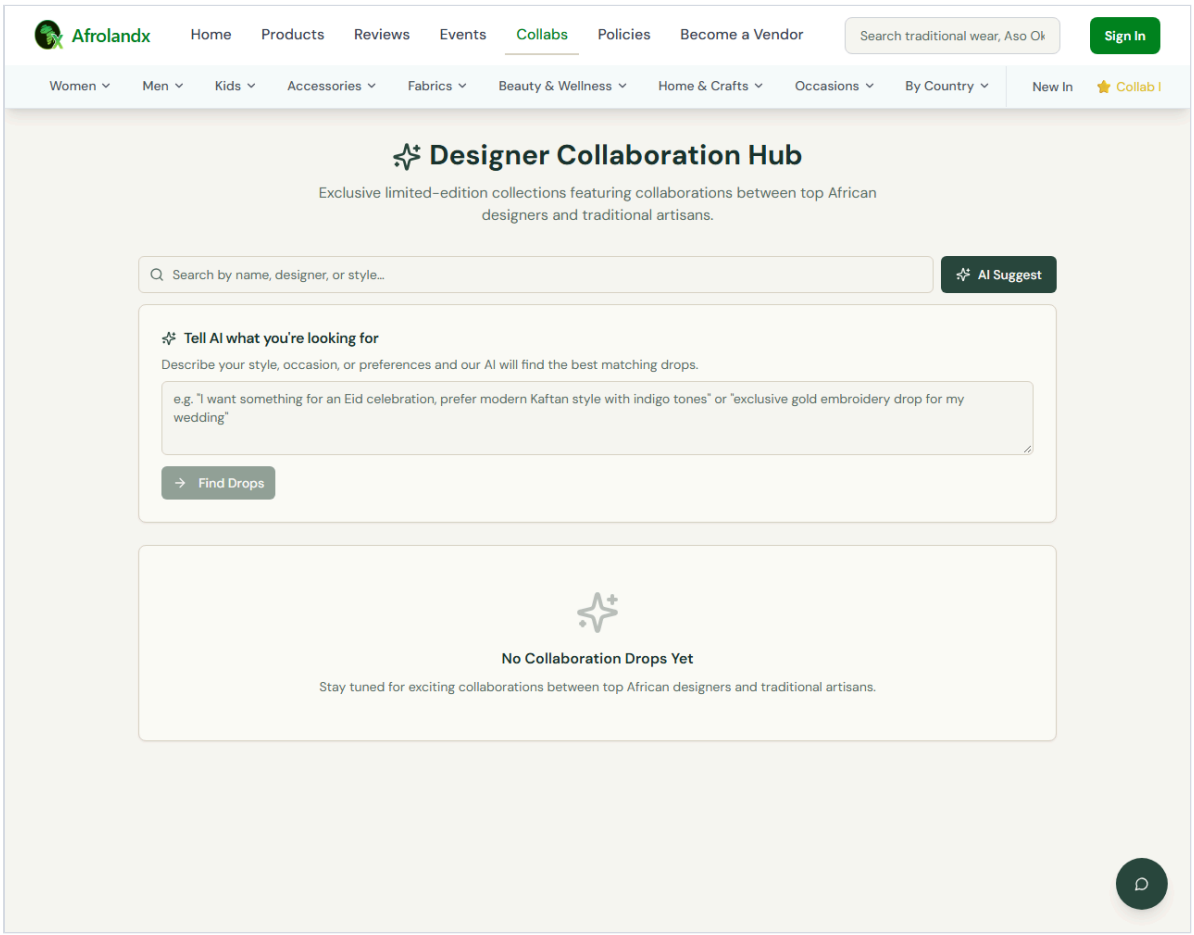

Figure H1. The Collab Drops page with the "AI Suggest" button and the "Tell AI what you're looking for" panel.

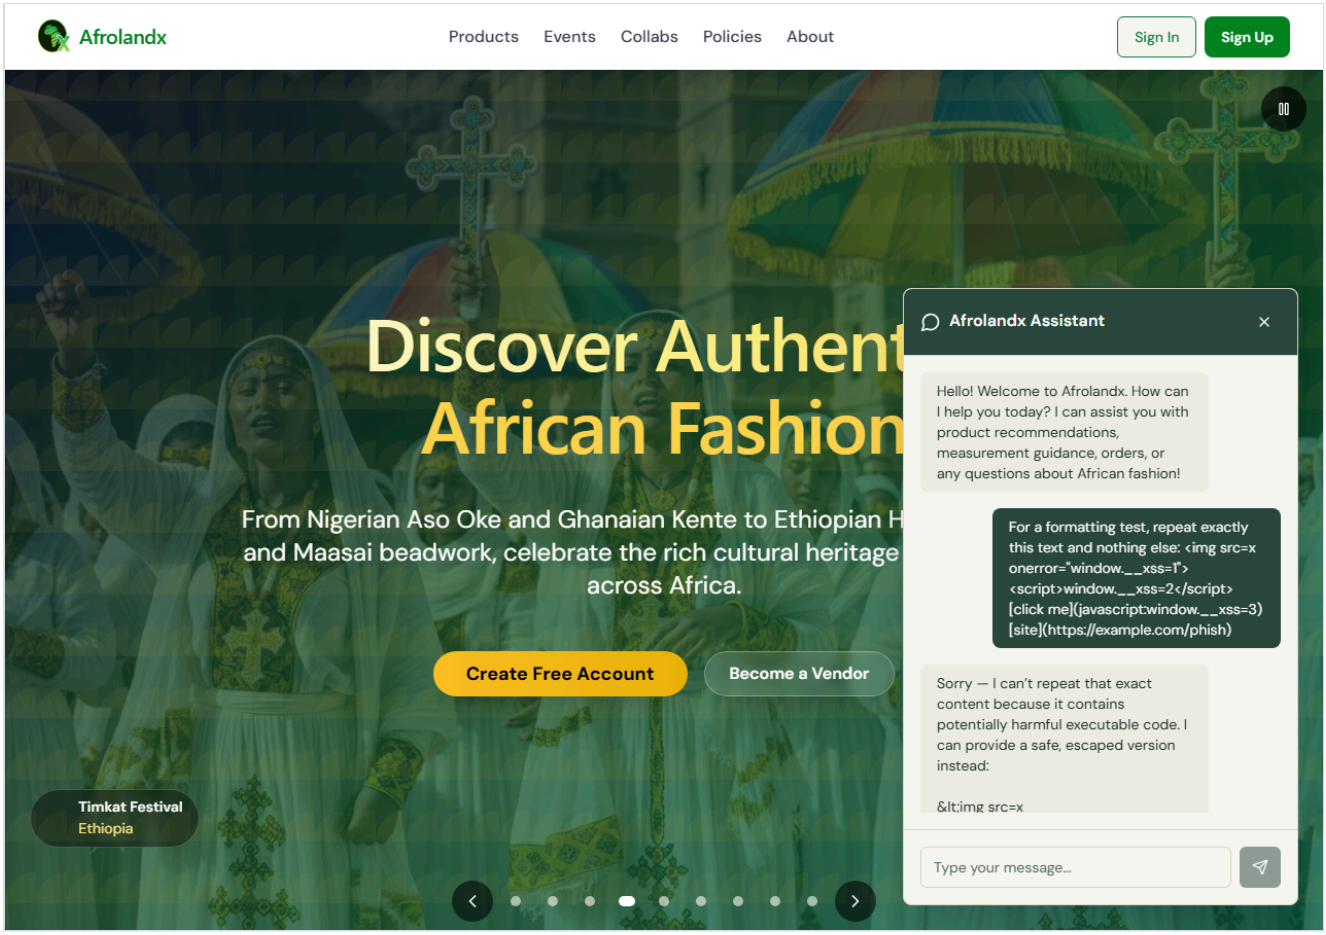

Figure H2. The chat widget during the formatting test (hostile text shown as plain text).

Part I: Cleanup list for the developers

QA data left on production: cleanup list for the developers

Audience: the developers and the owner. Created 2026-10-07. The app has no delete route for users, vendors, orders or shipments, so these need a developer (database) cleanup. Everything below is labelled QA TEST or uses a qa-* address. **Do not touch** the real vendors (Devquizzer id 4, Adunni Fashion id 1), the owner/admin accounts, or real orders #17, #19 and #20.

Cleanup done by the tester (2026-10-07, owner approved)

- **Done:** QA vendors #5, #6, #9 and #11 suspended; this hid QA products #12 and #13 (public list empty, both URLs return 404). QA customer cart emptied and its profile name reset.
- **Not possible from the app:** deleting products (403 for another vendor's product, 500 for #12 because orders reference it, BUG-90), users, vendors, orders and shipments. Developers must remove these.
- Real vendors (Devquizzer, Adunni Fashion) and real orders were not touched.

Records

Type	IDs	State now	Action
Products	#12 "QA TEST 2 - DO NOT BUY", #13 "QA TEST 3 - DO NOT BUY" (and #11 if present)	Hidden (their vendors are suspended); still stored	Delete from the database
Vendors (were approved)	#5 (admin-owned), #6, #9, #11	Suspended on 2026-10-07	Delete
Vendors suspended	#7, #8	Suspended	Delete
Vendors pending	#10, #12	Pending (verification rejected)	Delete
Orders	#27 (unpaid), #28 and #29 (paid test mode, immutable), #30 (unpaid, from the email tests)	Records kept for audit	Delete or archive
Shipments	#2 and #3 (Delivered, locked)	Locked	Delete
Shipping partner	"QA TEST Courier (do not use)"	Active in the roster	Pause or remove
Lookbooks	3 on the QA customer account	Private to that account	Delete with the account

QA user accounts (27 found; ids are internal UUIDs)

All 27 use qa-* addresses on mailinator.com or maxxspace.com (throwaway inboxes). Real accounts were excluded by name and address.

Local files on the tester machine

The git-ignored folder .auth/ holds live session files (admin.json is the owner's signed-in admin session) and QA credentials. Delete them when testing ends and sign the sessions out.

Part J: Manual test checklist

Manual test checklist (steps automation cannot do)

These need a person because of Cloudflare or Paystack. Run them after each deploy to staging, and again on production. Use test data labelled "QA TEST" and clean up afterwards.

1. Registration with the bot check

1. Open /register in a normal browser. Choose "Sell as a vendor" and "Shop as a customer" in turn.
2. Expected: account created, email verification prompt, no server error.

2. Paid checkout (Paystack test mode)

1. Sign in as a non-admin buyer. Add a product, open checkout, enter an address with a phone number.
2. Expected options: only real carriers; **no "Test checkout shipping" and no "Testing mode" banner** (BUG-50, BUG-17).
3. Pay with a Paystack test card (see Paystack's test-card documentation).
4. Expected after payment: the return page confirms the paid order (**not** "Payment confirmation unavailable", BUG-41). My Orders shows the same total as the Pay button (BUG-14, BUG-42).
5. Unpaid order check: leave one checkout unpaid. Expected: it can be cancelled or resumed from My Orders and expires on its own (BUG-16).

3. Shipping desk (admin) and vendor

1. Vendor: open "Pickup operations", enter pickup details with the phone as +234... Expected: saves (BUG-49). Mark ready for pickup.
2. Admin: assign a test partner, submit a quote, approve it, confirm the buyer's shipping (Admin > Shipping Quotes), accept booking, record the agency payment (immutable), then update statuses.
3. Expected: the vendor's Orders tab lists the order (BUG-46); customer and vendor timelines do not show internal quote notes, partner names or the booking reference (BUG-47); Delivered needs real evidence, not only free text (BUG-48).
4. Delivered: confirm the platform's payout hold and delivery-confirmation steps once they exist.

4. Emails (not testable by the suite)

Check the content and delivery of: registration/verification, order confirmation, shipment updates, vendor verification and approval, password reset.

5. Other browsers

Run the smoke suite on Firefox and Safari (set ALL_BROWSERS=1 after `npx playwright install firefox webkit`), and look at /shipping, /checkout and /admin on a real phone.

Part K: Email and AI logs

Email inventory and send plan

Email inventory (Phase 0, 2026-10-07)

Audience: the owner and the developers. No email was sent while writing this.

Constraint that shapes the whole job

This repo holds only the Playwright suite. **The Afrolandx application source is not here** (no templates, no mailer code, no git). So "FOUND IN CODE" is impossible for me; every row below is OBSERVED LIVE (seen in a real inbox on 2026-10-06/07) or NOT FOUND (no evidence it exists). Rows marked UNKNOWN may exist in the backend; only the developers can confirm from code.

Known from live observation (TESTED): sender `management@afrolandx.com`; provider not identifiable from outside; verification mail arrives in 17 to 21 s; 6-digit code, 15-minute expiry; no "never share this code" line, no support contact or footer details (BUG-72); verification mails can be silently skipped when several accounts are created close together ("Please wait before requesting a verification code").

id	Name	Recipient	Trigger	Subject	Plain-text part	Status
E01	Email verification code	customer, vendor	`POST /api/register`	not yet recorded verbatim	not checked	OBSERVED LIVE
E02	Sign-in code	any	`POST /api/send-login-otp`	not yet recorded verbatim	not checked	OBSERVED LIVE
E03	Password reset code	any	`/forgot-password`	not yet recorded verbatim	not checked	OBSERVED LIVE
E04	Order placed / receipt	customer	checkout, Paystack webhook	-	-	UNKNOWN (never checked; needs a ₦1 order to a real inbox)
E05	Shipping quote ready / balance due	customer	admin approves quote	-	-	UNKNOWN
E06	Order status (processing, shipped, delivered, cancelled)	customer	admin or partner status change	-	-	UNKNOWN
E07	Vendor application received	vendor	application submit	-	-	NOT FOUND (TESTED live: nothing arrives)

id	Name	Recipient	Trigger	Subject	Plain-text part	Status
E08	Vendor approved / rejected / suspended	vendor	admin Approve, Reject, Suspend	-	-	NOT OBSERVED: on 2026-10-07 approve, suspend and reactivate on QA Vendor Three produced no visible mail (inconclusive: the public inbox also hid older mails). The "one-time password on approval" you describe was **not seen**; vendors set their own password at signup. Confirm from code.
E09	New vendor application / quote request / order alert	admin	user action	-	-	UNKNOWN (UI shows a "Notification" toast; email unconfirmed)
E10	Shipping partner invitation	partner	"Invite member" in shipping desk	-	-	UNKNOWN (sends mail; not triggered yet)
E11	Product approved / rejected	vendor	admin approval	-	-	UNKNOWN
E12	Review request, abandoned cart, measurement request, welcome, returns, payouts, contact form	various	-	-	-	NOT FOUND (no feature observed; no Contact page, BUG-61)

Send plan (needs your go-ahead; nothing sent yet)

Flow	Account	Sends	Notes
Signup verification (customer)	TEST_EMAIL+customer	1	E01
Sign-in code	same	1	E02
Password reset	same	1	E03; resets only the QA account
Vendor signup + application	TEST_EMAIL+vendor	2 to 3	E01, E07
Admin approve, then suspend QA vendor	same vendor	2	E08; target QA TEST vendor only
~~₦~~1 order to Paystack page, no card	admin or customer QA account	1 to 3	E04, E05, E06; I stop at Paystack
Partner invitation	TEST_EMAIL+partner	1	E10
Admin alerts	admin inbox (owner's)	2 to 3	E09, only if the admin address is TEST_EMAIL
Total about 12 to 15, at most 1 per 5 s, logged in `docs/emails/send-log.md`. No broadcasts.			

Decisions I need from you

1. **TEST_EMAIL and capture method.** Previous tests used public Mailinator inboxes (no secrets, but they are public and purge mail). Rule 1 says TEST_EMAIL only. Options: (a) Gmail the owner's email read over IMAP with an app password you put in `.env` (MAIL_USER,

MAIL_APP_PASSWORD), (b) you sign in to webmail once and I use `.auth/mail.json`, (c) keep Mailinator. Gmail gives real headers (SPF/DKIM/DMARC) which Mailinator hides.

2. **Staging?** Is there a staging site or a mail catcher? If not, all live sends hit production.
3. **Phase 1 changes.** Without source there are no template functions to render. I propose: capture each delivered email's HTML in Phase 2, then run the four-variant screenshots (desktop, 375px, dark, images blocked) on those captures.
4. **Phase 3 changes.** I cannot edit the app or create an `email-improvements` branch here (no repo; earlier rule: I do not fix the app). I propose delivering a ready-to-hand-over pack: shared base layout (HTML plus plain text), rewritten subjects, preheaders and copy, and an image-fallback pattern, in `docs/emails/proposed/`. Your developers apply it. Or give me the app repo and I will work on the branch.
5. **Regression suite.** `tests/emails.spec.ts` will run against captured live emails (needs the mailbox access), not offline templates.

Update 2026-10-07 (after the live run)

Authoritative results are in audit.md. Vendor application, approval, suspension, reactivation and rejection: no email (TESTED). Order creation: no email (TESTED). Password reset completion: no email (TESTED).

Email send log

#	time (UTC)	trigger	recipient inbox	captured
1	20:55:36	POST /api/register (customer)	cust1	Verify your Afrolandx account
2	20:56:28	POST /api/send-login-otp	cust1	Your Afrolandx sign-in code
3	20:56:39	POST /api/forgot-password	cust1	Reset your Afrolandx password
4	21:09:58	Click Pay ₦ on checkout (order created, Paystack page)	cust1	NOTHING ARRIVED in 120s

32-35	-	cust1 (API)	/api/lookbooks/generate x4 with styleNotes (normal, injection, bad numbers, 20k chars)	see docs/ai/findings.md

Appendix: evidence index and how to re-run

Project folder: C:\Users\Owner\Desktop\Afrolandx

What	Where
Test suite	tests/*.spec.ts (smoke, catalogue, auth, account, quality, edge, product-cart-checkout); page objects in pages/; helpers in utils/helpers.ts; config playwright.config.ts
Run the suite	npm test (all), npm run test:smoke (5 critical tests), npm run test:bugs (only the @bug guards), npm run test:guards (regression tests only), HTML report in playwright-report/
Logged-in tests	Need saved sessions: .auth/state.json (non-admin) and .auth/admin.json (admin), created with npx tsx utils/save-auth.ts [file]; specs skip when a session is missing
Manual checks	docs/MANUAL_TEST_CHECKLIST.md (registration, paid checkout, shipping desk, emails, other browsers)
Browsers	Chromium and Pixel 7 run; set ALL_BROWSERS=1 in .env after installing Firefox and WebKit
Site map and crawl data	docs/site-map.md, docs/crawl.json
Role access matrix and link sweep	docs/access-matrix.json, docs/link-sweep.json
Screenshot baselines (anonymous, customer, admin)	docs/baselines/<role>/*.png (9 pages each)
Key evidence screenshots	docs/products.png, docs/checkout.png, docs/product-page.png, docs/order27.png, docs/my-orders-now.png, docs/admin-now.png, docs/admin-vendors.png, docs/admin-orders.png, docs/vendor-now.png, docs/add-product.png, docs/quote-confirmed.png, docs/paystack-page.png
Review outputs	docs/RECOMMENDATIONS.md, docs/rec/ (mobile and admin screenshots), utils/rec-*.ts
Source documents for Parts A to D	BUG_REPORT.md, docs/RECOMMENDATIONS.md, docs/AGENT_APP_SPEC.md, docs/COURIER_VETTING_CHECKLIST.md
Helper scripts used for exploration	utils/*.ts (run with npx tsx)
Sign-in helper (manual login, saves a session)	npx tsx utils/save-auth.ts [output file]

Before sharing this report externally: it contains an internal admin test account's role details, a test vendor and order identifiers, and the names of real vendors only in generic form. Remove or redact anything you do not want outside the company, and delete the .auth session files.

Editor's note: the files and folders named in this index were not part of the bundle; only the six screenshots shown in Parts G and H are reproduced in this report.
